User's Manual

NOTICE

No copying or reproduction of this document, in part or in whole, is permitted without the consent of LAPIS Semiconductor Co., Ltd.

The content specified herein is subject to change for improvement without notice.

The content specified herein is for the purpose of introducing LAPIS Semiconductor's products (hereinafter "Products"). If you wish to use any such Product, please be sure to refer to the specifications, which can be obtained from LAPIS Semiconductor upon request.

Examples of application circuits, circuit constants and any other information contained herein illustrate the standard usage and operations of the Products. The peripheral conditions must be taken into account when designing circuits for mass production.

Great care was taken in ensuring the accuracy of the information specified in this document. However, should you incur any damage arising from any inaccuracy or misprint of such information, LAPIS Semiconductor shall bear no responsibility for such damage.

The technical information specified herein is intended only to show the typical functions of and examples of application circuits for the Products. LAPIS Semiconductor does not grant you, explicitly or implicitly, any license to use or exercise intellectual property or other rights held by LAPIS Semiconductor and other parties. LAPIS Semiconductor shall bear no responsibility whatsoever for any dispute arising from the use of such technical information.

The Products specified in this document are intended to be used with general-use electronic equipment or devices (such as audio visual equipment, office-automation equipment, communication devices, electronic appliances and amusement devices).

The Products specified in this document are not designed to be radiation tolerant.

While LAPIS Semiconductor always makes efforts to enhance the quality and reliability of its Products, a Product may fail or malfunction for a variety of reasons.

Please be sure to implement in your equipment using the Products safety measures to guard against the possibility of physical injury, fire or any other damage caused in the event of the failure of any Product, such as derating, redundancy, fire control and fail-safe designs. LAPIS Semiconductor shall bear no responsibility whatsoever for your use of any Product outside of the prescribed scope or not in accordance with the instruction manual.

The Products are not designed or manufactured to be used with any equipment, device or system which requires an extremely high level of reliability the failure or malfunction of which may result in a direct threat to human life or create a risk of human injury (such as a medical instrument, transportation equipment, aerospace machinery, nuclear-reactor controller, fuel-controller or other safety device). LAPIS Semiconductor shall bear no responsibility in any way for use of any of the Products for the above special purposes. If a Product is intended to be used for any such special purpose, please contact a ROHM sales representative before purchasing.

If you intend to export or ship overseas any Product or technology specified herein that may be controlled under the Foreign Exchange and the Foreign Trade Law, you will be required to obtain a license or permit under the Law.

Preface

This manual describes the operation of the hardware of the 8-bit microcontroller ML610Q431/ML610Q432.

The following manuals are also available. Read them as necessary.

- nX-U8/100 Core Instruction Manual
Description on the basic architecture and the each instruction of the nX-U8/100 Core.
- MACU8 Assembler Package User's Manual
Description on the method of operating the relocatable assembler, the linker, the librarian, and the object converter and also on the specifications of the assembler language.
- CCU8 User's Manual
Description on the method of operating the compiler.
- CCU8 Programming Guide
Description on the method of programming.
- CCU8 Language Reference
Description on the language specifications.
- DTU8 Debugger User's Manual
Description on the method of operating the debugger DTU8.
- IDEU8 User's Manual
Description on the integrated development environment IDEU8.
- uEASE User's Manual
Description on the on-chip debug tool uEASE.
- uEASE connection Manual for ML610Q431/ML610Q432
Description about the connection between uEASE and ML610Q431/ML610Q432.
- FWuEASE Flash Writer Host Program User's Manual
Description on the Flash Writer host program.

Notation

Classification	Notation	Description
◆ Numeric value	xxh, xxH xxb	Indicates a hexadecimal number. x: Any value in the range of 0 to F Indicates a binary number; “b” may be omitted. x: A value 0 or 1
◆ Unit	word, W byte, B nibble, N mega-, M kilo-, K kilo-, k milli-, m micro-, μ nano-, n second, s (lower case)	1 word = 16 bits 1 byte = 8 bits 1 nibble = 4 bits 10^6 $2^{10} = 1024$ $10^3 = 1000$ 10^{-3} 10^{-6} 10^{-9} second
◆ Terminology	“H” level, “1” level “L” level, “0” level	Indicates high voltage signal levels V_{IH} and V_{OH} as specified by the electrical characteristics. Indicates low voltage signal levels V_{IL} and V_{OL} as specified by the electrical characteristics.
◆ Register description	R/W: Indicates that Read/Write attribute. “R” indicates that data can be read and “W” indicates that data can be written. “R/W” indicates that data can be read or written.	

Table of Contents

Chapter 1

1. Overview	1-1
1.1 Features.....	1-1
1.2 Configuration of Functional Blocks.....	1-4
1.2.1 Block Diagram of ML610Q431.....	1-4
1.2.2 Block Diagram of ML610Q432.....	1-5
1.3 Pins	1-6
1.3.1 Pin Layout.....	1-6
1.3.1.1 Pin Layout of ML610Q431 LQFP Package	1-6
1.3.1.2 Pin Layout of ML610Q432 LQFP Package	1-7
1.3.1.3 Pin Layout of ML610Q431 Chip.....	1-8
1.3.1.4 Pin Layout of ML610Q432 Chip.....	1-9
1.3.1.5 Pad Coordinates of ML610Q431 Chip.....	1-10
1.3.1.6 Pad Coordinates of ML610Q432 Chip.....	1-11
1.3.2 List of Pins.....	1-12
1.3.3 Description of Pins.....	1-16
1.3.4 Termination of Unused Pins	1-20

Chapter 2

2. CPU	2-1
2.1 Overview.....	2-1
2.2 Program Memory Space	2-1
2.3 Data Memory Space.....	2-2
2.4 Instruction Length.....	2-2
2.5 Data Type.....	2-2
2.6 Description of Registers.....	2-3
2.6.1 List of Registers	2-3
2.6.2 Data Segment Register (DSR)	2-4

Chapter 3

3. Reset Function	3-1
3.1 Overview.....	3-1
3.1.1 Features.....	3-1
3.1.2 Configuration.....	3-1
3.1.3 List of Pin	3-1
3.2 Description of Registers.....	3-2
3.2.1 List of Registers	3-2
3.2.2 Reset Status Register (RSTAT)	3-2
3.3 Description of Operation.....	3-3
3.3.1 Operation of System Reset Mode	3-3

Chapter 4

4. MCU Control Function.....	4-1
4.1 Overview.....	4-1
4.1.1 Features.....	4-1
4.1.2 Configuration	4-1
4.2 Description of Registers.....	4-2
4.2.1 List of Registers	4-2
4.2.2 Stop Code Acceptor (STPACP).....	4-3
4.2.3 Standby Control Register (SBYCON)	4-4
4.2.4 Block Control Register 0 (BLKCON0)	4-5
4.2.5 Block Control Register 1 (BLKCON1)	4-6

4.2.6	Block Control Register 2 (BLKCON2)	4-7
4.2.7	Block Control Register 3 (BLKCON3)	4-8
4.2.8	Block Control Register 4 (BLKCON4)	4-9
4.3	Description of Operation.....	4-11
4.3.1	Program Run Mode.....	4-11
4.3.2	HALT Mode	4-11
4.3.3	STOP Mode	4-12
4.3.3.1	STOP Mode When CPU Operates with Low-Speed Clock.....	4-12
4.3.3.2	STOP Mode When CPU Operates with High-Speed Clock	4-13
4.3.3.3	Note on Return Operation from STOP/HALT Mode	4-14
4.3.4	Block Control Function.....	4-15

Chapter 5

5.	Interrupts (INTs).....	5-1
5.1	Overview.....	5-1
5.1.1	Features.....	5-1
5.2	Description of Registers.....	5-2
5.2.1	List of Registers	5-2
5.2.2	Interrupt Enable Register 1 (IE1).....	5-3
5.2.3	Interrupt Enable Register 2 (IE2).....	5-4
5.2.4	Interrupt Enable Register 3 (IE3).....	5-5
5.2.5	Interrupt Enable Register 4 (IE4).....	5-6
5.2.6	Interrupt Enable Register 5 (IE5).....	5-7
5.2.7	Interrupt Enable Register 6 (IE6).....	5-8
5.2.8	Interrupt Enable Register 7 (IE7).....	5-9
5.2.9	Interrupt Request Register 0 (IRQ0).....	5-10
5.2.10	Interrupt Request Register 1 (IRQ1).....	5-11
5.2.11	Interrupt Request Register 2 (IRQ2).....	5-12
5.2.12	Interrupt Request Register 3 (IRQ3).....	5-13
5.2.13	Interrupt Request Register 4 (IRQ4).....	5-14
5.2.14	Interrupt Request Register 5 (IRQ5).....	5-15
5.2.15	Interrupt Request Register 6 (IRQ6).....	5-16
5.2.16	Interrupt Request Register 7 (IRQ7).....	5-17
5.3	Description of Operation.....	5-19
5.3.1	Maskable Interrupt Processing.....	5-20
5.3.2	Non-Maskable Interrupt Processing.....	5-20
5.3.3	Software Interrupt Processing.....	5-20
5.3.4	Notes on Interrupt Routine.....	5-21
5.3.5	Interrupt Disable State	5-24

Chapter 6

6.	Clock Generation Circuit.....	6-1
6.1	Overview.....	6-1
6.1.1	Features.....	6-1
6.1.2	Configuration	6-1
6.1.3	List of Pins	6-2
6.2	Description of Registers.....	6-2
6.2.1	List of Registers	6-2
6.2.2	Frequency Control Register 0 (FCON0)	6-3
6.2.3	Frequency Control Register 1 (FCON1)	6-5
6.3	Description of Operation.....	6-6
6.3.1	Low-Speed Clock	6-6
6.3.1.1	Low-Speed Clock Generation Circuit	6-6
6.3.1.2	Operation of Low-Speed Clock Generation Circuit	6-7
6.3.2	High-Speed Clock.....	6-8
6.3.2.1	500 kHz RC Oscillation.....	6-8

6.3.2.2	Crystal/Ceramic Oscillation Mode	6-9
6.3.2.3	Built-in PLL Oscillation Mode.....	6-10
6.3.2.4	External Clock Input Mode	6-10
6.3.2.5	Operation of High-Speed Clock Generation Circuit.....	6-11
6.3.3	Switching of System Clock.....	6-13
6.4	Specifying port registers	6-15
6.4.1	Functioning P21 (OUTCLK) as the high speed clock output	6-15
6.4.2	Functioning P22 (LSCLK) as the low speed clock output.....	6-16

Chapter 7

7.	Time Base Counter	7-1
7.1	Overview.....	7-1
7.1.1	Features.....	7-1
7.1.2	Configuration	7-1
7.2	Description of Registers.....	7-3
7.2.1	List of Registers	7-3
7.2.2	Low-Speed Time Base Counter (LTBR)	7-4
7.2.3	High-Speed Time Base Counter Divide Register (HTBDR)	7-5
7.2.4	Low-Speed Time Base Counter Frequency Adjustment Registers L and H (LTBADJL, LTBADJH).....	7-6
7.3	Description of Operation.....	7-7
7.3.1	Low-Speed Time Base Counter	7-7
7.3.2	High-Speed Time Base Counter	7-8
7.3.3	Low-Speed Time Base Counter Frequency Adjustment Function.....	7-9

Chapter 8

8.	Real Time Clock	8-1
8.1	Overview.....	8-1
8.1.1	Features.....	8-1
8.1.2	Configuration	8-1
8.2	Description of Registers.....	8-2
8.2.1	List of Registers	8-2
8.2.2	Real Time Clock Second Register (RTCSEC).....	8-3
8.2.3	Real Time Clock Minute Register (RTCMIN)	8-4
8.2.4	Real Time Clock Hour Register (RTCHOUR)	8-5
8.2.5	Real Time Clock Week Register (RTCWEEK).....	8-6
8.2.6	Real Time Clock Day Register (RTCDAY)	8-7
8.2.7	Real Time Clock Month Register (RTCMON).....	8-8
8.2.8	Real Time Clock Year Register (RTCYEAR)	8-9
8.2.9	Real Time Clock Control Register (RTCCON)	8-10
8.2.10	Real Time Clock Alarm 0 Minute Register (AL0MIN).....	8-11
8.2.11	Real Time Clock Alarm 0 Hour Register (AL0HOUR).....	8-12
8.2.12	Real Time Clock Alarm 0 Week Register (AL0WEEK)	8-13
8.2.13	Real Time Clock Alarm 1 Minute Register (AL1MIN).....	8-14
8.2.14	Real Time Clock Alarm 1 Hour Register (AL1HOUR).....	8-15
8.2.15	Real Time Clock Alarm 1 Day Register (AL1DAY).....	8-16
8.2.16	Real Time Clock Alarm 1 Month Register (AL1MON)	8-17
8.3	Description of Operation.....	8-18

Chapter 9

9.	Capture.....	9-1
9.1	Overview.....	9-1
9.1.1	Features.....	9-1
9.1.2	Configuration	9-1
9.1.3	List of Pins	9-1
9.2	Description of Registers.....	9-2

9.2.1 List of Registers	9-2
9.2.2 Capture Control Register (CAPCON).....	9-3
9.2.3 Capture Status Register (CAPSTAT)	9-4
9.2.4 Capture Data Register 0 (CAPR0).....	9-5
9.2.5 Capture Data Register 1 (CAPR1).....	9-6
9.3 Description of Operation.....	9-7

Chapter 10

10. 1 kHz Timer (1kHzTM).....	10-1
10.1 Overview.....	10-1
10.1.1 Features.....	10-1
10.1.2 Configuration	10-1
10.2 Description of Registers.....	10-2
10.2.1 List of Registers.....	10-2
10.2.2 1 kHz Timer Count Registers (T1KCRL, T1KCRH)	10-3
10.2.3 1 kHz Timer Control Register (T1KCON)	10-4
10.3 Description of Operation.....	10-5

Chapter 11

11. Timers	11-1
11.1 Overview.....	11-1
11.1.1 Features.....	11-1
11.1.2 Configuration	11-1
11.2 Description of Registers.....	11-2
11.2.1 List of Registers.....	11-2
11.2.2 Timer 0 Data Register (TM0D)	11-3
11.2.3 Timer 1 Data Register (TM1D)	11-4
11.2.4 Timer 2 Data Register (TM2D)	11-5
11.2.5 Timer 3 Data Register (TM3D)	11-6
11.2.6 Timer 0 Counter Register (TM0C)	11-7
11.2.7 Timer 1 Counter Register (TM1C)	11-8
11.2.8 Timer 2 Counter Register (TM2C)	11-9
11.2.9 Timer 3 Counter Register (TM3C)	11-10
11.2.10 Timer 0 Control Register 0 (TM0CON0)	11-11
11.2.11 Timer 1 Control Register 0 (TM1CON0)	11-12
11.2.12 Timer 2 Control Register 0 (TM2CON0)	11-13
11.2.13 Timer 3 Control Register 0 (TM3CON0)	11-14
11.2.14 Timer 0 Control Register 1 (TM0CON1)	11-15
11.2.15 Timer 1 Control Register 1 (TM1CON1)	11-16
11.2.16 Timer 2 Control Register 1 (TM2CON1)	11-17
11.2.17 Timer 3 Control Register 1 (TM3CON1)	11-18
11.3 Description of Operation.....	11-19

Chapter 12

12. PWM.....	12-1
12.1 Overview.....	12-1
12.1.1 Features.....	12-1
12.1.2 Configuration	12-1
12.1.3 List of Pins	12-2
12.2 Description of Registers.....	12-2
12.2.1 List of Registers.....	12-2
12.2.2 PWM0 Period Registers (PW0PL, PW0PH)	12-3
12.2.3 PWM0 Duty Registers (PW0DL, PW0DH).....	12-4
12.2.4 PWM0 Counter Registers (PW0CH, PW0CL)	12-5
12.2.5 PWM0 Control Register 0 (PW0CON0).....	12-6
12.2.6 PWM0 Control Register 1 (PW0CON1).....	12-7

12.3	Description of Operation.....	12-8
12.4	Specifying port registers.....	12-10
12.4.1	Functioning P43 (PWM0) as the PWM output.....	12-10
12.4.2	Functioning P34 (PWM0) as the PWM output.....	12-11

Chapter 13

13.	Watchdog Timer	13-1
13.1	Overview.....	13-1
13.1.1	Features.....	13-1
13.1.2	Configuration.....	13-1
13.2	Description of Registers.....	13-2
13.2.1	List of Registers.....	13-2
13.2.2	Watchdog Timer Control Register (WDTCON).....	13-3
13.2.3	Watchdog Timer Mode Register (WDTMOD).....	13-4
13.3	Description of Operation.....	13-5
13.3.1	Handling example when you do not want to use the watchdog timer.....	13-7

Chapter 14

14.	Synchronous Serial Port.....	14-1
14.1	Overview.....	14-1
14.1.1	Features.....	14-1
14.1.2	Configuration.....	14-1
14.1.3	List of Pins.....	14-2
14.2	Description of Registers.....	14-3
14.2.1	List of Registers.....	14-3
14.2.2	Serial Port Transmit/Receive Buffers (SIO0BUFL, SIO0BUFH).....	14-4
14.2.3	Serial Port Control Register (SIO0CON).....	14-5
14.2.4	Serial Port Mode Register 0 (SIO0MOD0).....	14-6
14.2.5	Serial Port Mode Register 1 (SIO0MOD1).....	14-7
14.3	Description of Operation.....	14-8
14.3.1	Transmit Operation.....	14-8
14.3.2	Receive Operation.....	14-9
14.3.3	Transmit/Receive Operation.....	14-10
14.4	Specifying port registers.....	14-11
14.4.1	Functioning P42 (SOUT0), P41 (SCK0) and P40 (SIN0) as the SSIO/ "Master mode".....	14-11
14.4.2	Functioning P42 (SOUT0), P41 (SCK0) and P40 (SIN0) as the SSIO/ "Slave mode".....	14-12
14.4.3	Functioning P46 (SOUT0), P45 (SCK0) and P44 (SIN0) as the SSIO/ "Master mode".....	14-13
14.4.4	Functioning P46 (SOUT0), P45 (SCK0) and P44 (SIN0) as the SSIO/ "Slave mode".....	14-14

Chapter 15

15.	UART	15-1
15.1	Overview.....	15-1
15.1.1	Features.....	15-1
15.1.2	Configuration.....	15-1
15.1.3	List of Pins.....	15-1
15.2	Description of Registers.....	15-2
15.2.1	List of Registers.....	15-2
15.2.2	UART0 Transmit/Receive Buffer (UA0BUF).....	15-3
15.2.3	UART0 Control Register (UA0CON).....	15-4
15.2.4	UART0 Mode Register 0 (UA0MOD0).....	15-5
15.2.5	UART0 Mode Register 1 (UA0MOD1).....	15-6
15.2.6	UART0 Baud Rate Registers L, H (UA0BRTL, UA0BRTH).....	15-8
15.2.7	UART0 Status Register (UA0STAT).....	15-9
15.3	Description of Operation.....	15-11
15.3.1	Transfer Data Format.....	15-11
15.3.2	Baud Rate.....	15-12

15.3.3	Transmit Data Direction	15-13
15.3.4	Transmit Operation.....	15-14
15.3.5	Receive Operation.....	15-16
15.4	Specifying port registers	15-18
15.4.1	Functioning P43(TXD0) and P42(RXD0) as the UART	15-18
15.4.2	Functioning P43(TXD0) and P02(RXD0) as the UART	15-19

Chapter 16

16.	I ² C Bus Interface.....	16-1
16.1	Overview.....	16-1
16.1.1	Features.....	16-1
16.1.2	Configuration	16-1
16.1.3	List of Pins	16-1
16.2	Description of Registers.....	16-2
16.2.1	List of Registers.....	16-2
16.2.2	I ² C Bus 0 Receive Register (I2C0RD).....	16-3
16.2.3	I ² C Bus 0 Slave Address Register (I2C0SA)	16-4
16.2.4	I ² C Bus 0 Transmit Data Register (I2C0TD)	16-5
16.2.5	I ² C Bus 0 Control Register (I2C0CON).....	16-6
16.2.6	I ² C Bus 0 Mode Register (I2C0MOD).....	16-7
16.2.7	I ² C Bus 0 Status Register (I2C0STAT)	16-8
16.3	Description of Operation.....	16-9
16.3.1	Communication Operating Mode.....	16-9
16.3.1.1	Start Condition.....	16-9
16.3.1.2	Restart Condition.....	16-9
16.3.1.3	Slave Address Transmit Mode.....	16-9
16.3.1.4	Data Transmit Mode.....	16-9
16.3.1.5	Data Receive Mode	16-9
16.3.1.6	Control Register Setting Wait State.....	16-9
16.3.1.7	Stop Condition.....	16-10
16.3.2	Communication Operation Timing	16-11
16.3.3	Operation Waveforms.....	16-13
16.4	Description of Operation.....	16-14
16.4.1	Functioning P41(SCL) and P40(SDA) as the I2C	16-14

Chapter 17

17.	NMI Pin	17-1
17.1	Overview.....	17-1
17.1.1	Features.....	17-1
17.1.2	Configuration	17-1
17.1.3	List of Pins	17-1
17.2	Description of Registers.....	17-2
17.2.1	List of Registers	17-2
17.2.2	NMI Data Register (NMID).....	17-3
17.2.3	NMI Control Register (NMICON)	17-4
17.3	Description of Operation.....	17-5
17.3.1	Interrupt Request.....	17-5

Chapter 18

18.	Port 0.....	18-1
18.1	Overview.....	18-1
18.1.1	Features.....	18-1
18.1.2	Configuration	18-1
18.1.3	List of Pins	18-1
18.2	Description of Registers.....	18-2
18.2.1	List of Registers.....	18-2

18.2.2	Port 0 Data Register (P0D)	18-3
18.2.3	Port 0 Control Registers 0, 1 (P0CON0, P0CON1)	18-4
18.2.4	External Interrupt Control Registers 0, 1 (EXICON0, EXICON1).....	18-5
18.2.5	External Interrupt Control Register 2 (EXICON2)	18-6
18.3	Description of Operation.....	18-7
18.3.1	External Interrupt/Capture Function	18-7
18.3.2	Interrupt Request.....	18-7

Chapter 19

19.	Port 1.....	19-1
19.1	Overview.....	19-1
19.1.1	Features.....	19-1
19.1.2	Configuration	19-1
19.1.3	List of Pins	19-1
19.2	Description of Registers.....	19-2
19.2.1	List of Registers.....	19-2
19.2.2	Port 1 Data Register (P1D)	19-3
19.2.3	Port 1 Control Registers 0, 1 (P1CON0, P1CON1)	19-4
19.3	Description of Operation.....	19-5
19.3.1	Input Port Function	19-5
19.3.2	Secondary Function	19-5

Chapter 20

20.	Port 2.....	20-1
20.1	Overview.....	20-1
20.1.1	Features.....	20-1
20.1.2	Configuration	20-1
20.1.3	List of Pins	20-1
20.2	Description of Registers.....	20-2
20.2.1	List of Registers.....	20-2
20.2.2	Port 2 Data Register (P2D)	20-3
20.2.3	Port 2 control registers 0, 1 (P2CON0, P2CON1)	20-4
20.2.4	Port 2 Mode Register (P2MOD)	20-5
20.3	Description of Operation.....	20-6
20.3.1	Output Port Function	20-6
20.3.2	Secondary Function	20-6

Chapter 21

21.	Port 3.....	21-1
21.1	Overview.....	21-1
21.1.1	Features.....	21-1
21.1.2	Configuration	21-1

Chapter 1

Overview

1. Overview

1.1 Features

This LSI is a high-performance 8-bit CMOS microcontroller into which rich peripheral circuits, such as real-time clock, synchronous serial port, UART, I²C bus interface (master), melody driver, battery level detect circuit, RC oscillation type A/D converter, 12-bit successive approximation type A/D converter, and LCD driver, are incorporated around 8-bit CPU nX-U8/100.

The CPU nX-U8/100 is capable of efficient instruction execution in 1-instruction 1-clock mode by 3-stage pipe line architecture parallel processing. The Flash ROM that is installed as program memory achieves low-voltage low-power consumption operation (read operation) equivalent to mask ROM and is most suitable for battery-driven applications. The on-chip debug function that is installed enables program debugging and programming.

- CPU
 - 8-bit RISC CPU (CPU name: nX-U8/100)
 - Instruction system: 16-bit instructions
 - Instruction set: Transfer, arithmetic operations, comparison, logic operations, multiplication/division, bit manipulations, bit logic operations, jump, conditional jump, call return stack manipulations, arithmetic shift, and so on
 - On-Chip debug function
 - Minimum instruction execution time
 - 30.5 μ s (@32.768 kHz system clock)
 - 0.24 μ s (@4.096 MHz system clock)
- Internal memory
 - Internal 64KByte Flash ROM (32K $\times$ 16 bits) (including unusable 1KByte TEST area)
 - Internal 2KByte Data RAM (2048 $\times$ 8 bits), 1KByte Display Allocation RAM (1024 $\times$ 8bit)
 - Internal 192-byte RAM for display
- Interrupt controller
 - 2 non-maskable interrupt sources (Internal source: 1, External source: 1)
 - 23 maskable interrupt sources (Internal sources: 19, External sources: 4)
- Time base counter
 - Low-speed time base counter $\times$ 1 channel
 - Frequency compensation (Compensation range: Approx. -488 ppm to $+488$ ppm. Compensation accuracy: Approx. 0.48ppm)
 - High-speed time base counter $\times$ 1 channel
- Watchdog timer
 - Non-maskable interrupt and reset
 - Free running
 - Overflow period: 4 types selectable (125ms, 500ms, 2s, and 8s)
- Timers
 - 8 bits $\times$ 4 channels (16-bit configuration available)
- 1 kHz timer
 - 10 Hz/1 Hz interrupt function

- Capture
 - Time base capture $\times 2$ channels (4096 Hz to 32 Hz)
- PWM
 - Resolution 16 bits $\times 1$ channel
- Real time clock
 - Year, month, day, day of the week, hour, minute, and second registers
 - Automatic leap year correction
 - Regular interrupts (0.5 sec, 1 sec, 1 minute, 1 hour)
 - Alarm interrupt $\times 2$ channels (day of the week, hour, minute; month, day hour, minute)
- Synchronous serial port
 - Master/slave selectable
 - LSB first/MSB first selectable
 - 8-bit length/16-bit length selectable
- UART
 - TXD/RXD $\times 1$ channel
 - Bit length, parity/no parity, odd parity/even parity, 1 stop bit/2 stop bits
 - Positive logic/negative logic selectable
 - Built-in baud rate generator
- I²C bus interface
 - Master function only
 - Fast mode (400 kbps@4MHz), standard mode (100 kbps@1MHz, 50kbps@500kHz)
- Melody driver
 - Scale: 29 types (Melody sound frequency: 508 Hz to 32.768 kHz)
 - Tone length: 63 types
 - Tempo: 15 types
 - Buzzer output mode (4 output modes, 8 frequencies, 16 duty levels)
- RC oscillation type A/D converter
 - 24-bit counter
 - Time division $\times 2$ channels
- Successive approximation type A/D converter
 - 12-bit A/D converter
 - Input $\times 2$ channels
- General-purpose ports
 - Non-maskable interrupt input port $\times 1$ channel
 - Input-only port $\times 6$ channels (including secondary functions)
 - Output-only port $\times 3$ channels (including secondary functions)
 - Input/output port
 - ML610Q431: 22 channels (including secondary functions)
 - ML610Q432: 14 channels (including secondary functions)

- LCD driver
 - Dot matrix can be supported.
ML610Q431: 1024 dots max. (64 seg × 16 com)
ML610Q432: 1536 dots max. (64 seg × 24 com)
 - 1/1 to 1/24 duty
 - 1/3 or 1/4 bias (built-in bias generation circuit)
 - Frame frequency selectable (approx. 64 Hz, 73 Hz, 85 Hz, and 102 Hz)
 - Bias voltage multiplying clock selectable (8 types)
 - Contrast adjustment (1/3 bias: 32 steps, 1/4 bias: 20 steps)
 - LCD drive stop mode, LCD display mode, all LCDs on mode, and all LCDs off mode selectable
 - Programmable display allocation function (available only when 1/1~1/8 duty is selected)
- Reset
 - Reset through the RESET_N pin
 - Power-on reset generation when powered on
 - Reset when oscillation stop of the low-speed clock is detected
 - Reset by the watchdog timer (WDT) overflow
- Power supply voltage detect function
 - Judgment voltages: One of 16 levels
 - Judgment accuracy: ±2% (Typ.)
- Clock
 - Low-speed clock: (This LSI can not guarantee the operation without low-speed clock)
Crystal oscillation (32.768 kHz)
 - High-speed clock:
Built-in RC oscillation (500 kHz)
Built-in PLL oscillation (8.192 MHz ±2.5%), crystal/ceramic oscillation (4.096 MHz), external clock
 - Selection of high-speed clock mode by software:
Built-in RC oscillation, built-in PLL oscillation, crystal/ceramic oscillation, external clock
- Power management
 - HALT mode: Instruction execution by CPU is suspended (peripheral circuits are in operating states).
 - STOP mode: Stop of low-speed oscillation and high-speed oscillation (Operations of CPU and peripheral circuits are stopped.)
 - Clock gear: The frequency of high-speed system clock can be changed by software (1/1, 1/2, 1/4, or 1/8 of the oscillation clock)
 - Block Control Function: Power down (reset registers and stop clock supply) the circuits of unused peripherals.
- Shipment
 - Chip (Die)
ML610Q431-xxxWA (Blank product: ML610Q431-NNNWA)
ML610Q432-xxxWA (Blank product: ML610Q432-NNNWA)
 - 144-pin plastic LQFP
ML610Q431-xxxTCZ03A (Blank product: ML610Q431-NNNTCZ03A)
ML610Q432-xxxTCZ03A (Blank product: ML610Q432-NNNTCZ03A)
xxx: ROM code number
- Guaranteed operating range
 - Operating temperature: -20°C to 70°C
 - Operating voltage: $V_{DD} = 1.1V$ to 3.6V, $AV_{DD} = 2.2V$ to 3.6V

1.3.3 Description of Pins

Pin name	I/O	Description	Primary/ Secondary/ Tertiary	Logic
System				
RESET_N	I	Reset input pin. When this pin is set to a "L" level, system reset mode is set and the internal section is initialized. When this pin is set to a "H" level subsequently, program execution starts. A pull-up resistor is internally connected.	—	Negative
XT0	I	Crystal connection pin for low-speed clock.	—	—
XT1	O	A 32.768 kHz crystal oscillator (see measuring circuit 1) is connected to this pin. Capacitors CDL and CGL are connected across this pin and V _{SS} as required.	—	—
OSC0	I	Crystal/ceramic connection pin for high-speed clock.	Secondary	—
OSC1	O	A crystal or ceramic is connected to this pin (4.1 MHz max.). Capacitors CDH and CGH (see measuring circuit 1) are connected across this pin and V _{SS} . This pin is used as the secondary function of the P10 pin(OSC0) and P11 pin(OSC1).	Secondary	—
LSCLK	O	Low-speed clock output pin. This pin is used as the secondary function of the P20 pin.	Secondary	—
OUTCLK	O	High-speed clock output pin. This pin is used as the secondary function of the P21 pin.	Secondary	—
General-purpose input port				
P00-P03	I	General-purpose input port. Since these pins have secondary functions, the pins cannot be used as a port when the secondary functions are used.	Primary	Positive
P10-P11	I	General-purpose input port. Since these pins have secondary functions, the pins cannot be used as a port when the secondary functions are used.	Primary	Positive
General-purpose output port				
P20-P22	O	General-purpose output port. Since these pins have secondary functions, the pins cannot be used as a port when the secondary functions are used.	Primary	Positive
General-purpose input/output port				
P30-P35	I/O	General-purpose input/output port. Since these pins have secondary functions, the pins cannot be used as a port when the secondary functions are used.	Primary	Positive
P40-P47	I/O	General-purpose input/output port. Since these pins have secondary functions, the pins cannot be used as a port when the secondary functions are used.	Primary	Positive
PA0-PA7	I/O	General-purpose input/output port. These pins are for the ML610Q431, but are not provided in the ML610Q432.	Primary	Positive

Pin name	I/O	Description	Primary/ Secondary/ Tertiary	Logic
UART				
TXD0	O	UART data output pin. This pin is used as the secondary function of the P43 pin.	Secondary	Positive
RXD0	I	UART data input pin. This pin is used as the secondary function of the P42 or the primary function of the P02 pin.	Primary/Secondary	Positive
I²C bus interface				
SDA	I/O	I ² C data input/output pin. This pin is used as the secondary function of the P40 pin. This pin has an NMOS open drain output. When using this pin as a function of the I ² C, externally connect a pull-up resistor.	Secondary	Positive
SCL	O	I ² C clock output pin. This pin is used as the secondary function of the P41 pin. This pin has an NMOS open drain output. When using this pin as a function of the I ² C, externally connect a pull-up resistor.	Secondary	Positive
Synchronous serial (SSIO)				
SCK0	I/O	Synchronous serial clock input/output pin. This pin is used as the tertiary function of the P41 or P45 pin.	Tertiary	—
SIN0	I	Synchronous serial data input pin. This pin is used as the tertiary function of the P40 or P44 pin.	Tertiary	Positive
SOUT0	O	Synchronous serial data output pin. This pin is used as the tertiary function of the P42 or P46 pin.	Tertiary	Positive
PWM				
PWM0	O	PWM0 output pin. This pin is used as the tertiary function of the P43 or P34 pin.	Tertiary	Positive
T02P0CK	I	PWM0 external clock input pin. This pin is used as the primary function of the P44 pin.	Primary	—
External interrupt				
NMI	I	External non-maskable interrupt input pin. An interrupt is generated on both edges.	Primary	Positive/negative
EXI0-3	I	External maskable interrupt input pins. Interrupt enable and edge selection can be performed for each bit by software. These pins are used as the primary functions of the P00-P03 pins.	Primary	Positive/negative
Capture				
CAP0	I	Capture trigger input pins. The value of the time base counter is captured in the register synchronously with the interrupt edge selected by software.	Primary	Positive/negative
CAP1	I	These pins are used as the primary functions of the P00 pin(CAP0) and P01 pin(CAP1).	Primary	Positive/negative
Timer				
T02P0CK	I	External clock input pin used for both Timer 0 and Timer 2. The clocks for these timers are selected by software. This pin is used as the primary function of the P44 pin.	Primary	—
T13P1CK	I	External clock input pin used for both Timer 1 and Timer 3. The clocks for these timers are selected by software. This pin is used as the primary function of the P45 pin.	Primary	—
Melody				
MD0	O	Melody/buzzer signal output pin. This pin is used as the secondary function of the P22 pin.	Secondary	Positive/negative
LED drive				
LED0-2	O	Nch open drain output pins to drive LED. These pins are used as the primary function of the P20-P22 pins.	Primary	Positive/negative

Pin name	I/O	Description	Primary/ Secondary/ Tertiary	Logic
RC oscillation type A/D converter				
IN0	I	Channel 0 oscillation input pin. This pin is used as the secondary function of the P30 pin.	Secondary	—
CS0	O	Channel 0 reference capacitor connection pin. This pin is used as the secondary function of the P31 pin.	Secondary	—
RS0	O	This pin is used as the secondary function of the P32 pin which is the reference resistor connection pin of Channel 0.	Secondary	—
RT0	O	Resistor sensor connection pin of Channel 0 for measurement. This pin is used as the secondary function of the P33 pin.	Secondary	—
RCT0	O	Resistor/capacitor sensor connection pin of Channel 0 for measurement. This pin is used as the secondary function of the P34 pin.	Secondary	—
RCM	O	RC oscillation monitor pin. This pin is used as the secondary function of the P35 pin.	Secondary	—
IN1	I	Oscillation input pin of Channel 1. This pin is used as the secondary function of the P44 pin.	Secondary	—
CS1	O	Reference capacitor connection pin of Channel 1. This pin is used as the secondary function of the P45 pin.	Secondary	—
RS1	O	Reference resistor connection pin of Channel 1. This pin is used as the secondary function of the P46 pin.	Secondary	—
RT1	O	Resistor sensor connection pin for measurement of Channel 1. This pin is used as the secondary function of the P47 pin.	Secondary	—
Successive approximation type A/D converter				
AV _{SS}	—	Negative power supply pin for successive approximation type A/D converter.	—	—
AV _{DD}	—	Positive power supply pin for successive approximation type A/D converter.	—	—
V _{REF}	—	Reference power supply pin for successive approximation type A/D converter.	—	—
AIN0	I	Channel 0 analog input for successive approximation type A/D converter.	—	—
AIN1	I	Channel 1 analog input for successive approximation type A/D converter.	—	—
LCD drive signal				
COM0-15	O	Common output pins.	—	—
COM16-23	O	Common output pins. These pins are for the ML610Q432, but are not provided in the ML610Q431.	—	—
SEG0-63	O	Segment output pin.	—	—
LCD driver power supply				
V _{L1}	—	Power supply pins for LCD bias (internally generated). Capacitors Ca, Cb, Cc, and Cd (see measuring circuit 1) are connected between V _{SS} and V _{L1} , V _{L2} , V _{L3} , and V _{L4} , respectively.	—	—
V _{L2}	—		—	—
V _{L3}	—		—	—
V _{L4}	—		—	—
C1	—	Power supply pins for LCD bias (internally generated). Capacitors C12 and C34 (see measuring circuit 1) are connected between C1 and C2 and between C3 and C4, respectively.	—	—
C2	—		—	—
C3	—		—	—
C4	—		—	—
For testing				
TEST	I/O	Input/output pin for testing. A pull-down resistor is internally connected.	—	—
Power supply				
V _{SS}	—	Negative power supply pin.	—	—
V _{DD}	—	Positive power supply pin.	—	—
V _{DDL}	—	Positive power supply pin (internally generated) for internal logic. Capacitors CL0 and CL1 (see measuring circuit 1) are connected between this pin and V _{SS} .	—	—

Pin name	I/O	Description	Primary/ Secondary/ Tertiary	Logic
V_{DDX}	—	Plus-side power supply pin (internally generated) for low-speed oscillation. Capacitor C_x (see measuring circuit 1) is connected between this pin and V_{SS} .	—	—
V_{PP}	—	Power supply pin for programming Flash ROM. A pull-up resistor is internally connected.	—	—

1.3.4 Termination of Unused Pins

Table 1-3 shows methods of terminating the unused pins.

Table 1-3 Termination of Unused Pins

Pin	Recommended pin termination
V_{PP}	Open
AV_{DD}	V_{SS}
AV_{SS}	V_{SS}
V_{REF}	V_{SS}
AIN0, AIN1	Open
V_{L1} , V_{L2} , V_{L3} , V_{L4}	Open
C1, C2, C3, C4	Open
RESET_N	Open
TEST	Open
NMI	Open
P00 to P03	V_{DD} or V_{SS}
P10 to P11	V_{DD}
P20 to P22	Open
P30 to P35	Open
P40 to P47	Open
PA0 to PA7	Open
COM0 to 23	Open
SEG0 to 63	Open

Note:

It is recommended to set the unused input ports and input/output ports to the inputs with pull-down resistors/pull-up resistors or the output mode since the supply current may become excessively large if the pins are left open in the high impedance input setting.

CPU and Memory Space

2. CPU and Memory Space

2.1 Overview

This LSI includes 8-bit CPU nX-U8/100 and the memory model is "SMALL model".
For details of the CPU nX-U8/100, see "nX-U8/100 Core Instruction Manual".

2.2 Program Memory Space

The program memory space is used to store program codes, table data (ROM window), or vector tables.
The program codes have a length of 16 bits and are specified by a 16-bit program counter (PC).
The ROM window area data has a length of 8 bits and can be used as table data.
The vector table, which has 16-bit long data, can be used as reset vectors, hardware interrupt vectors, and software interrupt vectors.
The program memory space consists of 1 segments and has 64-Kbyte (32-Kword) capacity.
Figure 2-1 shows the configuration of the program memory space.

Figure 2-1 Configuration of Program Memory Space

Notes:

- Since test program data is stored in the 1024Byte (512Word) test data area (0:0FC00H to 0:0FFFFH) of Segment 0, this area cannot be used as a program code area.
- The address "0: 0FC00H to 0: 0FDFH" in the test area is write-able and erase-able. Fill the area with "0FFH". If data in the area is uncertain or other data (i.e. not 0FFH), operating with the code can not be guranteed.
- The area 0:E000H to 0:FDFH of Segment 0 cannot be used as a ROM window area.
- Set "0FFH" data (BRK instruction) in the unused area of the program memory space.

2.3 Data Memory Space

The data memory space of this LSI consists of the ROM window area, 2KByte RAM area and SFR area of Segment 0 and the ROM reference areas of the Segment 1 and Segment 8.

The data memory stores 8-bit data and is specified by 20 bits consisting of higher 4 bits as DSR and lower 16 bits as addressing specified by each instruction.

Figure 2-2 shows the configuration of the data memory space.

Figure 2-2 Configuration of Data Memory Space

Notes:

- The contents of the 2-Kbyte RAM area are undefined at system reset. Initialize this area by software.
- The contents of Segment 0 of the program memory space is read from the ROM reference area of Segment 8.

2.4 Instruction Length

The length of a instruction is 16 bits.

2.5 Data Type

The data types supported include byte (8 bits) and word (16 bits).

2.6 Description of Registers

2.6.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F000H	Data segment register	DSR	—	R/W	8	00H

2.6.2 Data Segment Register (DSR)

Address: 0F000H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
DSR	—	—	—	—	DSR3	DSR2	DSR1	DSR0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

DSR is a special function register (SFR) to retain a data segment. For details of DSR, see “nX-U8/100 Core Instruction Manual”.

[Description of Bits]

- **DSR3-DSR0** (bits 3-0)

DSR3	DSR2	DSR1	DSR0	Description
0	0	0	0	Data segment 0 (initial value)
0	0	0	1	Prohibited
0	0	1	0	
0	0	1	1	
0	1	0	0	
0	1	0	1	
0	1	1	0	
0	1	1	1	
1	0	0	0	Data segment 8
1	0	0	1	Prohibited
1	0	1	0	
1	0	1	1	
1	1	0	0	
1	1	0	1	
1	1	1	0	
1	1	1	1	

Reset Function

3. Reset Function

3.1 Overview

This LSI has the five reset functions shown below. If any of the five reset conditions is satisfied, this LSI enters system reset mode.

- Reset by the RESET_N pin
- Reset by power-on detection
- Reset by the low-speed oscillation stop detection
- Reset by the 2nd watchdog timer (WDT) overflow
- Software reset by execution of the BRK instruction

3.1.1 Features

- The RESET_N pin has an internal pull-up resistor
- The low-speed oscillation stop detection time is 3 ms (typ.)
- 250 ms, 1 sec, 4 sec, or 16 sec can be selected as the 2nd watchdog timer (WDT) overflow period
- Built-in reset status register (RSTAT) indicating the reset generation causes
- Only the CPU is reset by the BRK instruction (neither the RAM area nor the SFR area are reset).

3.1.2 Configuration

Figure 3-1 shows the configuration of the reset generation circuit.

Figure 3-1 Configuration of Reset Generation Circuit

3.1.3 List of Pin

Pin name	I/O	Description
RESET_N	I	Reset input pin

3.2 Description of Registers

3.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F001H	Reset status register	RSTAT	—	R/W	8	—

3.2.2 Reset Status Register (RSTAT)

Address: 0F001H

Access: R/W

Access size: 8 bits

Initial value: Undefined

	7	6	5	4	3	2	1	0
RSTAT	—	—	—	—	—	WDTR	XSTR	POR
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	x	1

RSTAT is a special function register (SFR) that indicates the causes by which the reset is generated.

At the occurrence of reset, the contents of RSTAT are not initialized, while the bit indicating the cause of the reset is set to "1". When checking the reset cause using this function, perform write operation to RSTAT in advance and initialize the contents of RSTAT to "00H".

[Description of Bits]

- **POR** (bit 0)

The POR bit is a flag that indicates that the power-on reset is generated. This bit is set to "1" when powered on.

POR	Description
0	Power-on reset not generated
1	Power-on reset generated

- **XSTR** (bit 1)

The XSTR bit is a flag that indicates the generation of low-speed oscillation stop detect reset. When low-speed oscillation stops for the period specified by the low-speed oscillation stop detection time (TSTOP) or more, this bit is set to "1".

XSTR	Description
0	Low-speed oscillation stop detect reset not occurred
1	Low-speed oscillation stop detect reset occurred

- **WDTR** (bit 2)

The WSDTR is a flag that indicates that the watchdog timer reset is generated. This bit is set to "1" when the reset by overflow of the watchdog timer is generated.

WDTR	Description
0	Watchdog timer reset not occurred
1	Watchdog timer reset occurred

Note:

No flag is provided that indicates the occurrence of reset by the RESET_N pin.

3.3 Description of Operation

3.3.1 Operation of System Reset Mode

System reset has the highest priority among all the processings and any other processing being executed up to then is cancelled.

The system reset mode is set by any of the following causes.

- Reset by the RESET_N pin
- Reset by power-on detection
- Reset by low-speed oscillation stop detection
- Reset by 2nd watchdog timer (WDT) overflow
- Software reset by the BRK instruction (only the CPU is reset)

In system reset mode, the following processing is performed.

- (1) The power circuit is initialized, but not initialized by the reset by the BRK instruction execution. For the details of the power circuit, refer to Chapter 29, "Power Circuit".
- (2) All the special function registers (SFRs) whose initial value is not undefined are initialized. However, the initialization is not performed by software reset due to execution of the BRK instruction. See Appendix A "Registers" for the initial values of the SFRs.
- (3) CPU is initialized.
 - All the registers in CPU are initialized.
 - The contents of addresses 0000H and 0001H in the program memory are set to the stack pointer (SP).
 - The contents of addresses 0002H and 0003H in the program memory are set to the program counter (PC). However, when the interrupt level (ELLEV_L) of the program status word (PSW) at reset by the BRK instruction is 1 or lower, the contents of addresses 0004H and 0005H of the program memory are set in the program counter (PC). For the BRK instruction, see "nX-U8/100 Core Instruction Manual".

Note:

In system reset mode, the contents of data memory and those of any SFR whose initial value is undefined are not initialized and are undefined. Initialize them by software.

In system reset mode by the BRK instruction, no special function register (SFR) that has a fixed initial value is initialized either. Therefore initialize such an SFR by software.

MCU Control Function

4. MCU Control Function

4.1 Overview

The operating states of this LSI are classified into the following 4 modes including system reset mode:

System reset mode
Program run mode
HALT mode
STOP mode

For system reset mode, see Chapter 3, "Reset Function".

This LSI has a block control function, which power downs the circuits of unused peripherals (reset registers and stop clock supplies) to make even more reducing the current consumption.

4.1.1 Features

- HALT mode, where the CPU stops operating and only the peripheral circuit is operating
- STOP mode, where both low-speed oscillation and high-speed oscillation stop
- Stop code acceptor function, which controls transition to STOP mode
- Block control function, which power downs the circuits of unused peripherals (reset registers and stop clock supplies).

4.1.2 Configuration

Figure 4-1 shows an operating state transition diagram.

Figure 4-1 Operating State Transition Diagram

4.2 Description of Registers

4.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F008H	Stop code acceptor	STPACP	—	W	8	—
0F009H	Standby control register	SBYCON	—	W	8	00H
0F028H	Block control register 0	BLKCON0	—	R/W	8	00H
0F029H	Block control register 1	BLKCON1	—	R/W	8	00H
0F02AH	Block control register 2	BLKCON2	—	R/W	8	00H
0F02BH	Block control register 3	BLKCON3	—	R/W	8	00H
0F02CH	Block control register 4	BLKCON4	—	R/W	8	00H

4.2.2 Stop Code Acceptor (STPACP)

Address: 0F008H

Access: W

Access size: 8 bits

Initial value: — (Undefined)

	7	6	5	4	3	2	1	0
STPACP	—	—	—	—	—	—	—	—
W	W	W	W	W	W	W	W	W
Initial value	—	—	—	—	—	—	—	—

STPACP is a write-only special function register (SFR) that is used for setting a STOP mode.

When STPACP is read, "00H" is read.

When data is written to STPACP in the order of "5nH"(n: an arbitrary value) and "0AnH"(n: an arbitrary value), the stop code acceptor is enabled. When the STP bit of the standby control register (SBYCON) is set to "1" in this state, the mode is changed to the STOP mode. When the STOP mode is set, the STOP code acceptor is disabled.

When another instruction is executed between the instruction that writes "5nH" to STPACP and the instruction that writes "0AnH", the stop code acceptor is enabled after "0AnH" is written. However, if data other than "0AnH" is written to STPACP after "5nH" is written, the "5nH" write processing becomes invalid so that data must be written again starting from "5nH".

During a system reset, the stop code acceptor is disabled.

Note:

The STOP code acceptor can not be enabled on the condition of that both any interrupt enable flag and the corresponding interrupt request flag are "1"(An interrupt request occurrence with resetting MIE flag will have the condition).

4.2.3 Standby Control Register (SBYCON)

Address: 0F009H

Access: W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
SBYCON	—	—	—	—	—	—	STP	HLT
W	W	W	W	W	W	W	W	W
Initial value	0	0	0	0	0	0	0	0

SBYCON is a special function register (SFR) to control operating mode of MCU.

[Description of Bits]

- **STP** (bit 1)

The STP bit is used for setting the STOP mode. When the STP bit is set to “1” with the stop code adapter enabled by using STPACP, the mode is changed to the STOP mode. When the NMI interrupt request or the P00–P03 interrupt request enabled by the interrupt enable register 1 (IE1) is issued, the STP bit is set to “0” and the LSI returns to the program run mode.

- **HLT** (bit 0)

The HALT bit is used for setting a HALT mode. When the HALT bit is set to “1”, the mode is changed to the HALT mode. When the NMI interrupt request, WDT interrupt request, or enabled (the interrupt enable flag is “1”) interrupt request is issued, the HALT bit is set to “1” and the mode is returned to program run mode.

STP	HLT	Description
0	0	Program run mode (initial value)
0	1	HALT mode
1	0	STOP mode
1	1	Prohibited

Note:

The mode can not be changed to HALT mode or STOP mode on the condition of that both any interrupt enable flag and the corresponding interrupt request flag are “1”(An interrupt request occurrence with resetting MIE flag will have the condition).

When a maskable interrupt source (interrupt with enable bit) occurs while the MIE flag of the program status word (PSW) in the nX-U8/100 core is “0”, the STOP mode and the HALT mode are simply released and interrupt processing is not performed. Refer to the “nX-U8/100 Core Instruction Manual” for details of PSW.

4.2.4 Block Control Register 0(BLKCON0)

Address: 0F028H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
BLKCON0	—	—	—	—	DTM3	DTM2	DTM1	DTM0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

BLKCON0 is a special function register (SFR) to make even more reducing current consumption by turning unused peripherals off.

[Description of Bits]

- **DTM3** (bit 3)

The DTM3 bit is used to control Timer3 operation. When the DTM3 bit is set to “1”, the circuits related to Timer 3 are reset and turned off.

DTM3	Description
0	Enable operating Timer 3 (initial value)
1	Disable operating Timer 3

- **DTM2** (bit 2)

The DTM2 bit is used to control Timer2 operation. When the DTM2 bit is set to “1”, the circuits related to Timer 2 are reset and turned off.

DTM2	Description
0	Enable operating Timer 2 (initial value)
1	Disable operating Timer 2

- **DTM1** (bit 1)

The DTM1 bit is used to control Timer1 operation. When the DTM1 bit is set to “1”, the circuits related to Timer 1 are reset and turned off.

DTM1	Description
0	Enable operating Timer 1 (initial value)
1	Disable operating Timer 1

- **DTM0** (bit 0)

The DTM0 bit is used to control Timer3 operation. When the DTM0 bit is set to “1”, the circuits related to Timer 3 are reset and turned off.

DTM0	Description
0	Enable operating Timer 3 (initial value)
1	Disable operating Timer 3

Note:

When certain bits of block control registers are set to “1”, corresponding peripherals are reset (all registers are reset) and operating clocks for the peripherals stop. Writing to every SFR (special function register) in the corresponding peripherals is not valid while the bits of block control registers are set to “1” and returns the initial value for read. Ensure the bits are reset to “0” before using the peripherals to enable the operation.

See Chapter 11, “Timers” for detail about operation of Timer 0, Timer 1, Timer 2 and Timer 3.

4.2.5 Block Control Register 1(BLKCON1)

Address: 0F029H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
BLKCON1	—	DCAPR	—	DT1K	—	—	—	DPW0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

BLKCON1 is a special function register (SFR) to make even more reducing current consumption by turning unused peripherals off.

[Description of Bits]

- **DCAPR** (bit 6)

The DCAPR bit is used to control Capture operation. When the DCAPR bit is set to “1”, the circuits related to Capture are reset and turned off.

DCAPR	Description
0	Enable operating Capture (initial value)
1	Disable operating Capture

- **DT1K** (bit 4)

The DT1K bit is used to control 1kHz Timer operation. When the DT1K bit is set to “1”, the circuits related to 1kHz Timer are reset and turned off.

DT1K	Description
0	Enable operating 1kHz Timer (initial value)
1	Disable operating 1kHz Timer

- **DPW0** (bit 0)

The DPW0 bit is used to control PWM0 operation. When the DPW0 bit is set to “1”, the circuits related to PWM0 are reset and turned off.

DPW0	Description
0	Enable operating PWM0 (initial value)
1	Disable operating PWM0

Note:

When certain bits of block control registers are set to “1”, corresponding peripherals are reset (all registers are reset) and operating clocks for the peripherals stop. Writing to every SFR (special function register) in the corresponding peripherals is not valid while the bits of block control registers are set to “1” and returns the initial value for read. Ensure the bits are reset to “0” before using the peripherals to enable the operation.

See Chapter 9, “Capture” for detail about operation of Capture.

See Chapter 10, “1kHz Timer” for detail about operation of 1kHz Timer.

See Chapter 12, “PWM” for detail about operation of PWM.

4.2.6 Block Control Register 2(BLKCON2)

Address: 0F02AH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
BLKCON2	DI2C0	—	—	—	—	DUA0	—	DSIO0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

BLKCON2 is a special function register (SFR) to make even more reducing current consumption by turning unused peripherals off.

[Description of Bits]

- **DI2C0** (bit 7)

The DI2C0 bit is used to control I2C bus interface operation. When the DI2C0 bit is set to “1”, the circuits related to I2C bus interface are reset and turned off.

DI2C0	Description
0	Enable operating I2C (initial value)
1	Disable operating I2C

- **DUA0** (bit 2)

The DUA0 bit is used to control UART operation. When the DUA0 bit is set to “1”, the circuits related to UART are reset and turned off.

DUA0	Description
0	Enable operating UART (initial value)
1	Disable operating UART

- **DSIO0** (bit 0)

The DSIO0 bit is used to control SSIO operation. When the DSIO0 bit is set to “1”, the circuits related to SSIO are reset and turned off.

DSIO0	Description
0	Enable operating SSIO (initial value)
1	Disable operating SSIO

Note:

When certain bits of block control registers are set to “1”, corresponding peripherals are reset (all registers are reset) and operating clocks for the peripherals stop. Writing to every SFR (special function register) in the corresponding peripherals is not valid while the bits of block control registers are set to “1” and returns the initial value for read. Ensure the bits are reset to “0” before using the peripherals to enable the operation.

See Chapter 16, “I2C Bus Interface” for detail about operation of I2C Bus Interface.

See Chapter 15, “UART” for detail about operation of UART.

See Chapter 14, “Synchronous Serial Port” for detail about operation of SSIO.

4.2.7 Block Control Register 3(BLKCON3)

Address: 0F02BH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
BLKCON3	—	—	—	—	—	—	—	DMD0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

BLKCON3 is a special function register (SFR) to make even more reducing current consumption by turning unused peripherals off.

[Description of Bits]

- **DMD0** (bit 0)

The DMD0 bit is used to control Melody/Buzzer operation. When the DMD0 bit is set to “1”, the circuits related to Melody/Buzzer are reset and turned off.

DMD0	Description
0	Enable operating Melody/Buzzer (initial value)
1	Disable operating Melody/Buzzer

Note:

When certain bits of block control registers are set to “1”, corresponding peripherals are reset (all registers are reset) and operating clocks for the peripherals stop. Writing to every SFR (special function register) in the corresponding peripherals is not valid while the bits of block control registers are set to “1” and returns the initial value for read. Ensure the bits are reset to “0” before using the peripherals to enable the operation.

See Chapter 24, “Melody Driver” for detail about operation of Melody/Buzzer.

4.2.8 Block Control Register 4(BLKCON4)

Address: 0F02CH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
BLKCON4	—	DLCD	DBLD	DXTSP	—	—	DRAD	DSAD
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

BLKCON4 is a special function register (SFR) to make even more reducing current consumption by turning unused peripherals off.

[Description of Bits]

- **DLCD** (bit 6)

The DLCD bit is used to control LCD driver operation. When the DLCD bit is set to “1”, the circuits related to LCD driver are reset and turned off.

DLCD	Description
0	Enable operating LCD driver (initial value)
1	Disable operating LCD driver

- **DBLD** (bit 5)

The DBLD bit is used to control BLD (Battery Level Detector) operation. When the DBLD bit is set to “1”, the circuits related to BLD are reset and turned off.

DBLD	Description
0	Enable operating BLD (initial value)
1	Disable operating BLD driver

- **DXTSP** (bit 4)

The DXTSP bit is used to control 32kHz oscillation stop detect operation. Only during HALT mode, When the DXTSP bit is set to “1”, the circuits related to 32kHz oscillation stop detect are reset and turned off. When the operating mode is not in HALT, the 32kHz oscillation stop detect is always working regardless the condition of this bit.

DXTSP	Description
0	Enable operating 32kHz oscillation stop detect (initial value)
1	Disable operating 32kHz oscillation stop detect in HALT mode

- **DRAD** (bit 1)

The DRAD bit is used to control RC type A/D converter operation. When the DRAD bit is set to “1”, the circuits related to RC type A/D converter are reset and turned off.

DRAD	Description
0	Enable operating RC type A/D converter (initial value)
1	Disable operating RC type A/D converter

- **DSAD** (bit 0)

The DSAD bit is used to control SA type A/D converter operation. When the DSAD bit is set to “1”, the circuits related to SA type A/D converter are reset and turned off.

DSAD	Description
0	Enable operating SA type A/D converter (initial value)
1	Disable operating SA type A/D converter

Note:

When certain bits of block control registers are set to “1”, corresponding peripherals are reset (all registers are reset) and operating clocks for the peripherals stop. Writing to every SFR (special function register) in the corresponding peripherals is not valid while the bits of block control registers are set to “1” and returns the initial value for read. Ensure the bits are reset to “0” before using the peripherals to enable the operation.

See Chapter 27, “LCD Driver” for detail about operation of LCD driver.

See Chapter 28, “Battery Level Detector” for detail about operation of BLD.

See Chapter 3, “Reset Function” for detail about operation of 32kHz oscillation stop detector.

See Chapter 25, “RC Oscillation Type A/D Converter” for detail about operation of RC oscillation type A/D converter.

See Chapter 26, “Successive Approximation” for detail about operation of SA type A/D converter.

4.3 Description of Operation

4.3.1 Program Run Mode

The program run mode is the state where the CPU executes instructions sequentially.

At power-on reset, RESET_N pin reset, low-speed oscillation stop detect reset, or WDT overflow reset, the CPU executes instructions from the addresses that are set in addresses 0002H and 0003H of program memory (ROM) after the system reset mode is released.

At reset by the BRK instruction, the CPU executes instructions from the addresses that are set in the addresses 0004H and 0005H of the program memory after the system reset mode is released. However, when the value of the interrupt level bit (ELEVEL) of the program status word (PSW) is 02H or higher at execution of the BRK instruction (after the occurrence of the WDT interrupt or NMI interrupt), the CPU executes instructions from the addresses that are set in the addresses 0002H and 0003H.

For details of the BRK instruction and PSW, see the “nX-U8/100 Core Instruction Manual” and for the reset function, see Chapter 3, “Reset Function”.

4.3.2 HALT Mode

The HALT mode is the state where the CPU interrupts execution of instructions and only the peripheral circuits are running.

When the HLT bit of the standby control register (SBYCON) is set to “1”, the HALT mode is set.

When a NMI interrupt request, a WDT interrupt request, or an interrupt request enabled by an interrupt enable register (IE1–IE7) is issued, the HLT bit is set to “0” on the falling edge of the next system clock (SYSCLK) and the HALT mode is returned to the program run mode released.

Figure 4-2 shows the operation waveforms in HALT mode.

Figure 4-2 Operation Waveforms in HALT Mode

Note:

Since up to two instructions are executed during the period between HALT mode release and a transition to interrupt processing, place two NOP instructions next to the instruction that sets the HLT bit to “1”.

4.3.3 STOP Mode

The STOP mode is the state where low-speed oscillation and high-speed oscillation stop and the CPU and peripheral circuits stop the operation.

When the stop code acceptor is enabled by writing “5nH”(n: an arbitrary value) and “0AnH”(n: an arbitrary value) to the stop code acceptor (STPACP) sequentially and the STP bit of the standby control register (SBYCON) is set to “1”, the STOP mode is entered. When the STOP mode is set, the stop code acceptor is disabled.

When a NMI interrupt request or an interrupt-enabled (the interrupt enable flag is “1”) P00 to P003 interrupt request is issued, the STP bit is set to “0”, the STOP mode is released, and the mode is returned to the program run mode.

4.3.3.1 STOP Mode When CPU Operates with Low-Speed Clock

When the stop code acceptor is in the enabled state and the STP bit of SBYCON is set to “1”, the STOP mode is entered, stopping low-speed oscillation and high-speed oscillation.

When the NMI interrupt request or the interrupt-enabled (the interrupt enable flag is “1”) P00 to P03 interrupt request is issued, the STP bit is set to “0” and low-speed oscillation restarts. If the high-speed clock was oscillating before the STOP mode is entered, the high-speed oscillation restarts. When the high-speed clock was not oscillating before the STOP mode is entered, high-speed oscillation does not start.

When an interrupt request occurs, the STOP mode is released after the elapse of the low-speed oscillation start time (TXTL) and the low-speed clock (LSCLK) oscillation settling time (8192-pulse count), the mode is returned to the program mode, and the low-speed clock (LSCLK) restarts supply to the peripheral circuits. If the high-speed clock already started oscillation at this time, the high-speed clocks (OSCLK and HSCLK) also restart supply to the peripheral circuits.

For the low-speed oscillation start time (TXTL), see the “Electrical Characteristics” Section in Appendix C.

Figure 4-3 shows the operation waveforms in STOP mode when CPU operates with the low-speed clock.

Figure 4-3 Operation Waveforms in STOP Mode When CPU Operates with Low-Speed Clock

4.3.3.2 STOP Mode When CPU Operates with High-Speed Clock

When the CPU is operating with a high-speed clock and the STP bit of SBYCON is set to “1” with the stop code acceptor enabled, the STOP mode is entered and high-speed oscillation and low-speed oscillation stop.

When the NMI interrupt request or the interrupt-enabled (the interrupt enable flag is “1”) P00 to P03 interrupt request is issued, the STP bit is set to “0” and the low-speed and high-speed oscillation restart.

When an interrupt request is issued, the STOP mode is released after the elapse of the high-speed oscillation start time (TXTH/TRC) and the high-speed clock (OSCLK) oscillation stabilization time (8192-pulse count), the mode is returned to the program run mode, and the high-speed clocks (OSCLK and HSCLK) restart supply to the peripheral circuits.

The low-speed clock (LSCLK) restarts supply to the peripheral circuits after the elapse of the low-speed oscillation start time (TXTL) and low-speed clock (LSCLK) oscillation settling time (8192 count).

For the high-speed oscillation start time (TXTH) and low-speed oscillation start time (TXTL), see the “Electrical Characteristics” Section in Appendix C.

Figure 4-4 shows the operation waveforms in STOP mode when CPU operates with the high-speed clock.

Figure 4-4 Operation Waveforms in STOP Mode When CPU Operates with High-Speed Clock

Note:

The STOP mode is entered two cycles after the instruction that sets the STP bit to “1” and up to two instructions are executed during the period between STOP mode release and a transition to interrupt processing. Therefore, place two NOP instructions next to the instruction that set the STP bit to “1”.

4.3.3.3 Note on Return Operation from STOP/HALT Mode

The operation of returning from the STOP mode and HALT mode varies according to the interrupt level (ELEVEL) of the program status word (PSW), master interrupt enable flag (MIE), the contents of the interrupt enable register (IE0 to IE3), and whether the interrupt is a non-maskable interrupt or a maskable interrupt.

For details of PSW and the IE and IRQ registers, see “nX-U8/100 Core Instruction Manual” and Chapter 5, “Interrupt”, respectively.

Table 4-1 and Table 4-2 show the return operations from STOP/HALT mode.

Table 4-1 Return Operation from STOP/HALT Mode (Non-Maskable Interrupt)

ELEVEL	MIE	IEn.m	IRQn.m	Return operation from STOP/HALT mode
*	*	—	0	Not returned from STOP/HALT mode.
3	*	—	1	After the mode is returned from STOP/HALT mode, the program operation restarts from the instruction following the instruction that sets the STP/HLT bit to “1”. The program operation does not go to the interrupt routine.
0, 1, 2	*	—	1	After the mode is returned from the STOP/HALT mode, program operation restarts from the instruction following the instruction that sets the STP/HLT bit to “1”, then goes to the interrupt routine.

Table 4-2 Return Operation from STOP/HALT Mode (Maskable Interrupt)

ELEVEL	MIE	IEn.m	IRQn.m	Return operation from STOP/HALT mode
*	*	*	0	Not returned from STOP/HALT mode.
*	*	0	1	
*	0	1	1	After the mode is returned from STOP/HALT mode, the program operation restarts from the instruction following the instruction that sets the STP/HLT bit to “1”. The program operation does not go to the interrupt routine.
2,3	1	1	1	
0, 1	1	1	1	After the mode is returned from the STOP/HALT mode, program operation restarts from the instruction following the instruction that sets the STP/HLT bit to “1”, then goes to the interrupt routine.

Notes:

- If the ELEVEL bit is 0H, it indicates that the CPU is performing neither nonmaskable interrupt processing nor maskable interrupt processing nor software interrupt processing.
- If the ELEVEL bit is 1H, it indicates that the CPU is performing maskable interrupt processing or software interrupt processing. (ELEVEL is set during interrupt transition cycle.)
- If the ELEVEL bit is 2H, it indicates that the CPU is performing non-maskable interrupt processing. (ELEVEL is set during interrupt transition cycle.)
- If the ELEVEL bit is 3H, it indicates that the CPU is performing interrupt processing specific to the emulator. This setting is not allowed in normal applications.

4.3.4 Block Control Function

This LSI has a block control function, which resets and completely turns operating circuits of unused peripherals off to make even more reducing current consumption.

When certain bits of block control registers are set to “1”, corresponding peripherals are reset (all registers are reset) and operating clocks for the peripherals stop. Writing to every SFR (special function register) in the corresponding peripherals is not valid while the bits of block control registers are set to “1” and returns the initial value for read. Ensure the bits are reset to “0” before using the peripherals to enable the operation.

BLKCON0 register controls(disables/enables) operation of Timer 0, Timer 1, Timer 2 and Timer 3.

BLKCON1 register controls(disables/enables) operation of Capture, 1kHz Timer and PWM.

BLKCON2 register controls(disables/enables) operation of I2C, UART and SSIO.

BLKCON3 register controls(disables/enables) operation of Melody/Buzzer.

BLKCON4 register controls(disables/enables) operation of LCD driver, Battery Level Detector, 32kHz oscillation stop detector, RC type A/D converter and SAR type A/D converter.

Note:

DXTSP bit (bit 4) of BLKCON4 register disables the operation of 32kHz oscillation stop detector in HALT mode only. See the each chapter for detail about the operation of each peripheral and relevant notes.

Chapter 5

Interrupts (INTs)

5. Interrupts (INTs)

5.1 Overview

This LSI has 25 interrupt sources (External interrupts: 5 sources, Internal interrupts: 20 sources) and a software interrupt (SWI).

For details of each interrupt, see the following chapters:

- Chapter 7, "Time Base Counter"
- Chapter 8, "Real Time Clock"
- Chapter 10, "1 kHz Timer"
- Chapter 11, "Timer"
- Chapter 12, "PWM"
- Chapter 13, "Watchdog Timer"
- Chapter 14, "Synchronous Serial Port"
- Chapter 15, "UART"
- Chapter 16, "I²C Bus Interface"
- Chapter 17, "NMI"
- Chapter 18, "Port0"
- Chapter 19, "Port1"
- Chapter 20, "Port2"
- Chapter 21, "Port3"
- Chapter 24, "Melody Driver"
- Chapter 25, "RC Oscillation Type A/D Converter"
- Chapter 26, "Successive Approximation Type A/D Converter"

5.1.1 Features

- 2 non-maskable interrupt sources (Internal source: 1, External source: 1)
- 23 maskable interrupt sources (Internal sources: 19, External sources: 4)
- Software interrupt (SWI): 64 sources max.
- External interrupts allow edge selection and sampling selection.

5.2 Description of Registers

5.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F011H	Interrupt enable register 1	IE1	—	R/W	8	00H
0F012H	Interrupt enable register 2	IE2	—	R/W	8	00H
0F013H	Interrupt enable register 3	IE3	—	R/W	8	00H
0F014H	Interrupt enable register 4	IE4	—	R/W	8	00H
0F015H	Interrupt enable register 5	IE5	—	R/W	8	00H
0F016H	Interrupt enable register 6	IE6	—	R/W	8	00H
0F017H	Interrupt enable register 7	IE7	—	R/W	8	00H
0F018H	Interrupt request register 0	IRQ0	—	R/W	8	00H
0F019H	Interrupt request register 1	IRQ1	—	R/W	8	00H
0F01AH	Interrupt request register 2	IRQ2	—	R/W	8	00H
0F01BH	Interrupt request register 3	IRQ3	—	R/W	8	00H
0F01CH	Interrupt request register 4	IRQ4	—	R/W	8	00H
0F01DH	Interrupt request register 5	IRQ5	—	R/W	8	00H
0F01EH	Interrupt request register 6	IRQ6	—	R/W	8	00H
0F01FH	Interrupt request register 7	IRQ7	—	R/W	8	00H

5.2.2 Interrupt Enable Register 1 (IE1)

Address: 0F011H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
IE1	—	—	—	—	EP03	EP02	EP01	EP00
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

IE1 is a special function register (SFR) to control enable/disable for each interrupt request.

When an interrupt is accepted, the master interrupt enable flag (MIE) is set to “0”, but the corresponding flag of IE1 is not reset.

[Description of Bits]

- **EP00** (bit 0)

EP00 is the enable flag for the input port P00 pin interrupt (P00INT).

EP00	Description
0	Disabled (initial value)
1	Enabled

- **EP01** (bit 1)

EP01 is the enable flag for the input port P01 pin interrupt (P01INT).

EP01	Description
0	Disabled (initial value)
1	Enabled

- **EP02** (bit 2)

EP02 is the enable flag for the input port P02 pin interrupt (P02INT).

EP02	Description
0	Disabled (initial value)
1	Enabled

- **EP03** (bit 3)

EP03 is the enable flag for the input port P03 pin interrupt (P03INT).

EP03	Description
0	Disabled (initial value)
1	Enabled

5.2.3 Interrupt Enable Register 2 (IE2)

Address: 0F012H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
IE2	EI2C0	—	—	—	—	ESAD	—	ESIO0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

IE2 is a special function register (SFR) to control enable/disable for each interrupt request.

When an interrupt is accepted, the master interrupt enable flag (MIE) is set to “0”, but the corresponding flag of IE2 is not reset.

[Description of Bits]

- **ESIO0** (bit 0)

ESIO0 is the enable flag for the synchronous serial port 0 interrupt (SIO0INT).

ESIO0	Description
0	Disabled (initial value)
1	Enabled

- **ESAD** (bit 2)

ESAD is the enable flag for the successive approximation type A/D converter interrupt (SADINT).

ESAD	Description
0	Disabled (initial value)
1	Enabled

- **EI2C0** (bit 7)

EI2C0 is the enable flag for the I2C bus 0 interrupt (I2C0INT).

EI2C0	Description
0	Disabled (initial value)
1	Enabled

5.2.4 Interrupt Enable Register 3 (IE3)

Address: 0F013H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
IE3	—	—	—	—	—	—	ETM1	ETM0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

IE3 is a special function register (SFR) to control enable/disable for each interrupt request.

When an interrupt is accepted, the master interrupt enable flag (MIE) is set to “0”, but the corresponding flag of IE3 is not reset.

[Description of Bits]

- **ETM0** (bit 0)

ETM0 is the enable flag for the timer 0 interrupt (TM0INT).

ETM0	Description
0	Disabled (initial value)
1	Enabled

- **ETM1** (bit 1)

ETM1 is the enable flag for the timer 1 interrupt (TM1INT).

ETM1	Description
0	Disabled (initial value)
1	Enabled

5.2.5 Interrupt Enable Register 4 (IE4)

Address: 0F014H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
IE4	—	—	ERAD	—	—	EMD0	—	EUA0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

IE4 is a special function register (SFR) to control enable/disable for each interrupt request.

When an interrupt is accepted, the master interrupt enable flag (MIE) is set to “0”, but the corresponding flag of IE4 is not reset.

[Description of Bits]

- **EUA0** (bit 0)

EUA0 is the enable flag for the UART0 interrupt (UA0INT).

EUA0	Description
0	Disabled (initial value)
1	Enabled

- **EMD0** (bit 2)

EMD0 is the enable flag for the melody 0 interrupt (MD0INT).

EMD0	Description
0	Disabled (initial value)
1	Enabled

- **ERAD** (bit 5)

ERAD is the enable flag for the RC oscillation type A/D converter interrupt (RADINT).

ERAD	Description
0	Disabled (initial value)
1	Enabled

5.2.6 Interrupt Enable Register 5 (IE5)

Address: 0F015H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
IE5	—	—	ETM3	ETM2	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

IE5 is a special function register (SFR) to control enable/disable for each interrupt request.

When an interrupt is accepted, the master interrupt enable flag (MIE) is set to “0”, but the corresponding flag of IE5 is not reset.

[Description of Bits]

- **ETM2** (bit 4)

ETM2 the enable flag for the timer 2 interrupt (TM2INT).

ETM2	Description
0	Disabled (initial value)
1	Enabled

- **ETM3** (bit 5)

ETM3 the enable flag for the timer 3 interrupt (TM3INT)

ETM3	Description
0	Disabled (initial value)
1	Enabled

5.2.7 Interrupt Enable Register 6 (IE6)

Address: 0F016H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
IE6	E32H	—	E128H	ET1K	—	—	—	EPW0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

IE6 is a special function register (SFR) to control enable/disable for each interrupt request.

When an interrupt is accepted, the master interrupt enable flag (MIE) is set to “0”, but the corresponding flag of IE6 is not reset.

[Description of Bits]

- **EPW0** (bit 0)

EPW0 is the enable flag for the PWM0 interrupt (PW0INT)

EPW0	Description
0	Disabled (initial value)
1	Enabled

- **ET1K** (bit 4)

ET1K is the enable flag for the 1 kHz timer interrupt (T1KINT).

ET1K	Description
0	Disabled (initial value)
1	Enabled

- **E128H** (bit 5)

E128H is the enable flag for the time base counter 128 Hz interrupt (T128HINT).

E128H	Description
0	Disabled (initial value)
1	Enabled

- **E32H** (bit 7)

E32H is the enable flag for the time base counter 32 Hz interrupt (T32HINT).

E32H	Description
0	Disabled (initial value)
1	Enabled

5.2.8 Interrupt Enable Register 7 (IE7)

Address: 0F017H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
IE7	EAL1	EAL0	ERTC	—	E2H	—	—	E16H
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

IE7 is a special function register (SFR) to control enable/disable for each interrupt request.

When an interrupt is accepted, the master interrupt enable flag (MIE) is set to “0”, but the corresponding flag of IE7 is not reset.

[Description of Bits]

- **E16H** (bit 0)

E16H is the enable flag for the time base counter 16 Hz interrupt (T16HINT).

E16H	Description
0	Disabled (initial value)
1	Enabled

- **E2H** (bit 3)

E2H is the enable flag for the time base counter 2 Hz interrupt (T2HINT).

E2H	Description
0	Disabled (initial value)
1	Enabled

- **ERTC** (bit 5)

ERTC is the enable flag for the RTC interrupt (RTCINT).

ERTC	Description
0	Disabled (initial value)
1	Enabled

- **EAL0** (bit 6)

EAL0 is the enable flag for the RTC alarm interrupt 0 (AL0INT).

EAL0	Description
0	Disabled (initial value)
1	Enabled

- **EAL1** (bit 7)

EAL1 is the enable flag for the RTC alarm interrupt 1 (AL1INT).

EAL1	Description
0	Disabled (initial value)
1	Enabled

5.2.9 Interrupt Request Register 0 (IRQ0)

Address: 0F018H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
IRQ0	—	—	—	—	—	—	QNMI	QWDT
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

IRQ0 is a special function register (SFR) to request an interrupt for each interrupt source.

The watchdog timer interrupt (WDTINT) and the NMI interrupt (NMINT) are non-maskable interrupts that do not depend on MIE. In this case, an interrupt is requested to the CPU regardless of the value of the Mask Interrupt Enable flag (MIE).

Each IRQ0 request flag is set to “1” regardless of the MIE value when an interrupt is generated. By setting the IRQ0 request flag to “1” by software, an interrupt can be generated.

The corresponding flag of IRQ0 is set to “0” by hardware when the interrupt request is accepted by the CPU.

[Description of Bits]

- **QWDT** (bit 0)

QWDT is the request flag for the watchdog timer interrupt (WDTINT).

QWDT	Description
0	No request (initial value)
1	Request

- **QNMI** (bit 1)

QNMI is the request flag for the NMI interrupt (NMINT).

QNMI	Description
0	No request (initial value)
1	Request

Note:

When an interrupt is generated by the write instruction to the interrupt request register (IRQ0), the interrupt shift cycle starts after the next 1 instruction is executed.

5.2.10 Interrupt Request Register 1 (IRQ1)

Address: 0F019H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
IRQ1	—	—	—	—	QP03	QP02	QP01	QP00
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

IRQ1 is a special function register (SFR) to request an interrupt for each interrupt source.

Each IRQ1 request flag is set to “1” regardless of the IE1 and MIE values when an interrupt is generated. In this case, an interrupt is requested to the CPU when the related flag of the interrupt enable register (IE1) is set to “1” and the master interrupt enable flag (MIE) is set to “1”.

By setting the IRQ1 request flag to “1” by software, an interrupt can be generated.

The corresponding flag of IRQ1 is set to “0” by hardware when the interrupt request is accepted by the CPU.

[Description of Bits]

- **QP00** (bit 0)

QP00 is the request flag for the input port P00 pin interrupt (P00INT).

QP00	Description
0	No request (initial value)
1	Request

- **QP01** (bit 1)

QP01 is the request flag for the input port P01 pin interrupt (P01INT).

QP01	Description
0	No request (initial value)
1	Request

- **QP02** (bit 2)

QP02 is the request flag for the input port P02 pin interrupt (P02INT).

QP02	Description
0	No request (initial value)
1	Request

- **QP03** (bit 3)

QP03 is the request flag for the input port P03 pin interrupt (P03INT).

QP03	Description
0	No request (initial value)
1	Request

Note:

When an interrupt is generated by the write instruction to the interrupt request register (IRQ1) or to the interrupt enable register (IE1), the interrupt shift cycle starts after the next 1 instruction is executed.

5.2.11 Interrupt Request Register 2 (IRQ2)

Address: 0F01AH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
IRQ2	QI2C0	—	—	—	—	QSAD	—	QSIO0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

IRQ2 is a special function register (SFR) to request an interrupt for each interrupt source.

Each IRQ2 request flag is set to “1” regardless of the IE2 and MIE values when an interrupt is generated. In this case, an interrupt is requested to the CPU when the related flag of the interrupt enable register (IE2) is set to “1” and the master interrupt enable flag (MIE) is set to “1”.

By setting the IRQ2 request flag to “1” by software, an interrupt can be generated.

The corresponding flag of IRQ2 is set to “0” by hardware when the interrupt request is accepted by the CPU.

[Description of Bits]

- **QSIO0** (bit 0)

QSIO0 is the request flag for the synchronous serial port 0 interrupt (SIO0INT).

QSIO0	Description
0	No request (initial value)
1	Request

- **QSAD** (bit 2)

QSAD is the request flag for the successive approximation type A/D converter interrupt (SADINT)

QSAD	Description
0	No request (initial value)
1	Request

- **QI2C0** (bit 7)

QI2C0 is the request flag for the I2C bus 0 interrupt (I2C0INT).

QI2C0	Description
0	No request (initial value)
1	Request

Note:

When an interrupt is generated by the write instruction to the interrupt request register (IRQ2) or to the interrupt enable register (IE2), the interrupt shift cycle starts after the next 1 instruction is executed.

5.2.12 Interrupt Request Register 3 (IRQ3)

Address: 0F01BH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
IRQ3	—	—	—	—	—	—	QTM1	QTM0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

IRQ3 is a special function register (SFR) to request an interrupt for each interrupt source.

Each IRQ3 request flag is set to “1” regardless of the IE3 and MIE values when an interrupt is generated. In this case, an interrupt is requested to the CPU when the related flag of the interrupt enable register (IE3) is set to “1” and the master interrupt enable flag (MIE) is set to “1”.

By setting the IRQ3 request flag to “1” by software, an interrupt can be generated.

The corresponding flag of IRQ3 is set to “0” by hardware when the interrupt request is accepted by the CPU.

[Description of Bits]

- **QTM0** (bit 0)

QTM0 is the request flag for the timer 0 interrupt (TM0INT).

QTM0	Description
0	No request (initial value)
1	Request

- **QTM1** (bit 1)

QTM1 is the request flag for the timer 1 interrupt (TM1INT).

QTM1	Description
0	No request (initial value)
1	Request

Note:

When an interrupt is generated by the write instruction to the interrupt request register (IRQ3) or to the interrupt enable register (IE3), the interrupt shift cycle starts after the next 1 instruction is executed.

5.2.13 Interrupt Request Register 4 (IRQ4)

Address: 0F01CH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
IRQ4	—	—	QRAD	—	—	QMD0	—	QUA0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

IRQ4 is a special function register (SFR) to request an interrupt for each interrupt source.

Each IRQ4 request flag is set to “1” regardless of the IE4 and MIE values when an interrupt is generated. In this case, an interrupt is requested to the CPU when the related flag of the interrupt enable register (IE4) is set to “1” and the master interrupt enable flag (MIE) is set to “1”.

By setting the IRQ4 request flag to “1” by software, an interrupt can be generated.

The corresponding flag of IRQ4 is set to “0” by hardware when the interrupt request is accepted by the CPU.

[Description of Bits]

- **QUA0** (bit 0)
QUA0 is the request flag for the UART0 interrupt (UA0INT).

QUA0	Description
0	No request (initial value)
1	Request

- **QMD0** (bit 2)
QMD0 is the request flag for the melody 0 interrupt (MD0INT).

QMD0	Description
0	No request (initial value)
1	Request

- **QRAD** (bit 5)
QRAD is the request flag for the RC oscillation type A/D converter interrupt (RADINT).

QRAD	Description
0	No request (initial value)
1	Request

Note:

When an interrupt is generated by the write instruction to the interrupt request register (IRQ4) or to the interrupt enable register (IE4), the interrupt shift cycle starts after the next 1 instruction is executed.

5.2.14 Interrupt Request Register 5 (IRQ5)

Address: 0F01DH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
IRQ5	—	QTM3	QTM2	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

IRQ5 is a special function register (SFR) to request an interrupt for each interrupt source.

Each IRQ5 request flag is set to “1” regardless of the IE5 and MIE values when an interrupt is generated. In this case, an interrupt is requested to the CPU when the related flag of the interrupt enable register (IE5) is set to “1” and the master interrupt enable flag (MIE) is set to “1”.

By setting the IRQ5 request flag to “1” by software, an interrupt can be generated.

The corresponding flag of IRQ5 is set to “0” by hardware when the interrupt request is accepted by the CPU.

[Description of Bits]

- **QTM2** (bit 5)

QTM2 is the request flag for the timer 2 interrupt (TM2INT).

QTM2	Description
0	No request (initial value)
1	Request

- **QTM3** (bit 6)

QTM3 is the request flag for the timer 3 interrupt (TM3INT).

QTM3	Description
0	No request (initial value)
1	Request

Note:

When an interrupt is generated by the write instruction to the interrupt request register (IRQ5) or to the interrupt enable register (IE5), the interrupt shift cycle starts after the next 1 instruction is executed.

5.2.15 Interrupt Request Register 6 (IRQ6)

Address: 0F01EH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
IRQ6	Q32H	—	Q128H	QT1K	—	—	—	QPW0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

IRQ6 is a special function register (SFR) to request an interrupt for each interrupt source.

Each IRQ6 request flag is set to “1” regardless of the IE6 and MIE values when an interrupt is generated. In this case, an interrupt is requested to the CPU when the related flag of the interrupt enable register (IE6) is set to “1” and the master interrupt enable flag (MIE) is set to “1”.

By setting the IRQ6 request flag to “1” by software, an interrupt can be generated.

The corresponding flag of IRQ6 is set to “0” by hardware when the interrupt request is accepted by the CPU.

[Description of Bits]

- **QPW0** (bit 0)

QPW0 is the request flag for the PWM0 interrupt (PW0INT).

QPW0	Description
0	No request (initial value)
1	Request

- **QT1K** (bit 4)

QT1K is the request flag for the 1 kHz timer interrupt (T1KINT).

QT1K	Description
0	No request (initial value)
1	Request

- **Q128H** (bit 5)

Q128H is the request flag for the time base counter 128 Hz interrupt (T128HINT).

Q128H	Description
0	No request (initial value)
1	Request

- **Q32H** (bit 7)

Q32H is the request flag for the time base counter 32 Hz interrupt (T32HINT).

Q32H	Description
0	No request (initial value)
1	Request

Note:

When an interrupt is generated by the write instruction to the interrupt request register (IRQ6) or to the interrupt enable register (IE6), the interrupt shift cycle starts after the next 1 instruction is executed.

5.2.16 Interrupt Request Register 7 (IRQ7)

Address: 0F01FH
Access: R/W
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
IRQ7	QAL1	QAL0	QRTC	—	Q2H	—	—	Q16H
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

IRQ7 is a special function register (SFR) to request an interrupt for each interrupt source. Each IRQ7 request flag is set to “1” regardless of the IE7 and MIE values when an interrupt is generated. In this case, an interrupt is requested to the CPU when the related flag of the interrupt enable register (IE7) is set to “1” and the master interrupt enable flag (MIE) is set to “1”.

By setting the IRQ7 request flag to “1” by software, an interrupt can be generated.

The corresponding flag of IRQ7 is set to “0” by hardware when the interrupt request is accepted by the CPU.

[Description of Bits]

- **Q16H** (bit 0)

Q16H is the request flag for the time base counter 8 Hz interrupt (T8HINT).

Q16H	Description
0	No request (initial value)
1	Request

- **Q2H** (bit 3)

Q2H is the request flag for the time base counter 2 Hz interrupt (T2HINT).

Q2H	Description
0	No request (initial value)
1	Request

- **QRTC** (bit 5)

QRTC is the request flag for the RTC interrupt (RTCINT).

QRTC	Description
0	No request (initial value)
1	Request

- **QAL0** (bit 6)

QAL0 is the request flag for the RTC alarm 0 interrupt (AL0INT).

QAL0	Description
0	No request (initial value)
1	Request

- **QAL1** (bit 7)

QAL1 is the request flag for the RTC alarm 1 interrupt (AL1INT).

QAL1	Description
0	No request (initial value)
1	Request

Note:

When an interrupt is generated by the instruction to write to the interrupt request register (IRQ7) or to the interrupt enable register (IE7), the the interrupt shift cycle starts after the next 1 instruction is executed.

5.3 Description of Operation

With the exception of the watchdog timer interrupt (WDTINT) and the NMI interrupt (NMINT), interrupt enable/disable for 23 sources is controlled by the master interrupt enable flag (MIE) and the individual interrupt enable registers (IE1 to 7). WDTINT and NMINT are non-maskable interrupts.

When the interrupt conditions are satisfied, the CPU calls a branching destination address from the vector table determined for each interrupt source and the interrupt shift cycle starts to branch to the interrupt processing routine.

Table 5-1 lists the interrupt sources.

Table 5-1 Interrupt Sources

Priority	Interrupt source	Symbol	Vector table address
1	Watchdog timer interrupt	WDTINT	0008H
2	NMI interrupt	NMINT	000AH
3	P00 interrupt	P00INT	0010H
4	P01 interrupt	P01INT	0012H
5	P02 interrupt	P02INT	0014H
6	P03 interrupt	P03INT	0016H
7	Synchronous serial port 0 interrupt	SIO0INT	0020H
8	Successive approximation type A/D converter interrupt	SADINT	0024H
9	I ² C bus 0 interrupt	I2C0INT	002EH
10	Timer 0 interrupt	TM0INT	0030H
11	Timer 1 interrupt	TM1INT	0032H
12	UART 0 interrupt	UA0INT	0040H
13	Melody 0 interrupt	MD0INT	0044H
14	RC oscillation type A/D converter interrupt	RADINT	004AH
15	Timer 2 interrupt	TM2INT	0058H
16	Timer 3 interrupt	TM3INT	005AH
17	PWM0 interrupt	PW0INT	0060H
18	1 kHz timer interrupt	T1KINT	0068H
19	TBC128Hz interrupt	T128HINT	006AH
20	TBC32Hz interrupt	T32HINT	006EH
21	TBC16Hz interrupt	T16HINT	0070H
22	TBC2Hz interrupt	T2HINT	0076H
23	RTC interrupt	RTCINT	007AH
24	RTC alarm 0 interrupt	AL0INT	007CH
25	RTC alarm 1 interrupt	AL1INT	007EH

Note:

- When multiple interrupts are generated concurrently, the interrupts are serviced according to this priority and processing of low-priority interrupts is pending.
- Please define vector tables for all unused interrupts for fail safe.

5.3.1 Maskable Interrupt Processing

When an interrupt is generated with the MIE flag set to “1”, the following processing is executed by hardware and the processing of program shifts to the interrupt destination.

- (1) Transfer the program counter (PC) to ELR1.
- (2) Transfer CSR to ECSR1.
- (3) Transfer PSW to EPSW1.
- (4) Set the MIE flag to “0”.
- (5) Set the ELEVEL field to “1”.
- (6) Load the interrupt start address into PC.

5.3.2 Non-Maskable Interrupt Processing

When an interrupt is generated regardless of the state of MIE flag, the following processing is performed by hardware and the processing of program shifts to the interrupt destination.

- (1) Transfer PC to ELR2.
- (2) Transfer CSR to ECSR2.
- (3) Transfer PSW to EPSW2.
- (4) Set the ELEVEL field to “2”.
- (5) Load the interrupt start address into PC.

5.3.3 Software Interrupt Processing

A software interrupt is generated as required within an application program. When the SWI instruction is performed within the program, a software interrupt is generated, the following processing is performed by hardware, and the processing program shifts to the interrupt destination. The vector table is specified by the SWI instruction.

- (1) Transfer PC to ELR1.
- (2) Transfer CSR to ECSR1.
- (3) Transfer PSW to EPSW1.
- (4) Set the MIE flag to “0”.
- (5) Set the ELEVEL field to “1”.
- (6) Load the interrupt start address into PC.

Reference:

For the MIE flag, Program Counter (PC), CSR, PSW, and ELEVEL, see “nX-U8/100 Core Instruction Manual”.

5.3.4 Notes on Interrupt Routine

Notes are different in programming depending on whether a subroutine is called or not by the program in executing an interrupt routine, whether multiple interrupts are enabled or disabled, and whether such interrupts are maskable or non-maskable.

State A: Maskable interrupt is being processed

A-1: When a subroutine is not called by the program in executing an interrupt routine

A-1-1: When multiple interrupts are disabled

- Processing immediately after the start of interrupt routine execution
No specific notes.
- Processing at the end of interrupt routine execution
Specify the RTI instruction to return the contents of the ELR register to the PC and those of the EPSW register to PSW.

A-1-2: When multiple interrupts are enabled

- Processing immediately after the start of interrupt routine execution
Specify "PUSH ELR, EPSW" to save the interrupt return address and the PSW status in the stack.
- Processing at the end of interrupt routine execution
Specify "POP PC, PSW" instead of the RTI instruction to return the contents of the stack to PC and PSW.

Example of description: State A-1-1

Intrpt_A-1-1;	; A-1-1 state
DI	; Disable interrupt
:	
:	
:	
RTI	; Return PC from ELR ; Return PSW form EPSW ; End

Example of description: State A-1-2

Intrpt_A-1-2;	; Start
PUSH ELR, EPSW	; Save ELR and EPSW at the beginning
EI	; Enable interrupt
:	
:	
:	
:	
POP PC, PSW	; Return PC from the stack ; Return PSW from the stack ; End

A-2: When a subroutine is called by the program in executing an interrupt routine

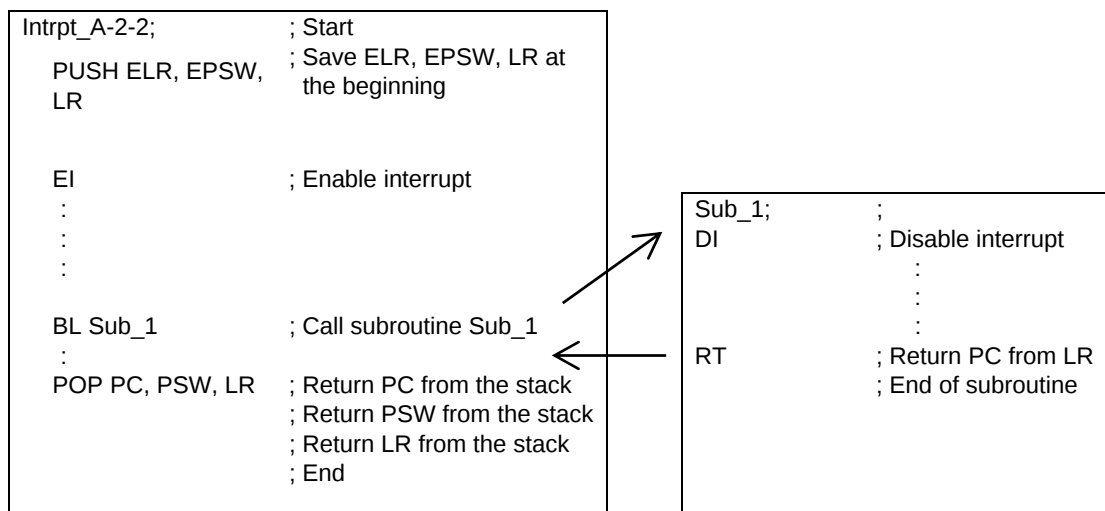

A-2-1: When multiple interrupts are disabled

- Processing immediately after the start of interrupt routine execution
Specify the "PUSH LR" instruction to save the subroutine return address in the stack.
- Processing at the end of interrupt routine execution
Specify "POP LR" immediately before the RTI instruction to return from the interrupt processing after returning the subroutine return address to LR.

A-2-2: When multiple interrupts are enabled

- Processing immediately after the start of interrupt routine execution
Specify "PUSH LR, ELR, EPSW" to save the interrupt return address, the subroutine return address, and the EPSW status in the stack.
- Processing at the end of interrupt routine execution
Specify "POP PC, PSW, LR" instead of the RTI instruction to return the saved data of the interrupt return address to PC, the saved data of EPSW to PSW, and the saved data of LR to LR.

Example of description: A-2-2

State B: Non-maskable interrupt is being processed

B-1: When no instruction is executed in an interrupt routine

- Processing immediately after the start of interrupt routine execution
Specify the RTI instruction to return the contents of the ELR register to the PC and those of the EPSW register to PSW.

B-2: When one or more instructions are executed in an interrupt routine

B-2-1: When a subroutine is not called by the program in executing an interrupt routine

- Processing immediately after the start of interrupt routine execution
Specify "PUSH ELR, EPSW" to save the interrupt return address and the PSW status in the stack.
- Processing at the end of interrupt routine execution
Specify "POP PC, PSW" instead of the RTI instruction to return the contents of the stack to PC and PSW.

B-2-2: When a subroutine is called by the program in executing an interrupt routine

- Processing immediately after the start of interrupt routine execution
Specify "PUSH LR, ELR, EPSW" to save the interrupt return address, the subroutine return address, and the EPSW status in the stack.

- Processing at the end of interrupt routine execution

Specify "POP PC, PSW, LR" instead of the RTI instruction to return the saved data of the interrupt return address to PC, the saved data of EPSW to PSW, and the saved data of LR to LR..

Example of description: B-1

```
Intrpt_B-1:      ; B-1 state
RTI              ; Return PC from ELR
                ; Return PSW form EPSW
                ; End
```

Example of description: B-2-1

```
Intrpt_B-2-1:    ; Start
PUSH ELR , EPSW  ; Save ELR, EPSW at the
                ; beginning
:
:
:
POP PC , PSW     ; Return PC from the stack
                ; Return PSW from the stack
                ; End
```

Example of description: B-2-2

```
Intrpt_B-2-2:    ; Start
PUSH ELR,EPSW,LR ; Save ELR, EPSW, LR at the
                ; beginning
:
:
:
BL Sub_1         ; Call subroutine Sub_1
:
POP PC , PSW , LR ; Return PC from the stack
                ; Return PSW from the stack
                ; Return LR from the stack
                ; End
```

```
Sub_1:           ;
:
:
:
:
RT              ; Return PC from LR
                ; End of subroutine
```

5.3.5 Interrupt Disable State

Even if the interrupt conditions are satisfied, an interrupt may not be accepted depending on the operating state. This is called an interrupt disabled state. See below for the interrupt disabled state and the handling of interrupts in this state.

Interrupt disabled state 1: Between the interrupt shift cycle and the instruction at the beginning of the interrupt routine

When the interrupt conditions are satisfied in this section, an interrupt is generated immediately following the execution of the instruction at the beginning of the interrupt routine corresponding to the interrupt that has already been enabled.

Interrupt disabled state 2: Between the DSR prefix instruction and the next instruction

When the interrupt conditions are satisfied in this section, an interrupt is generated immediately after execution of the instruction following the DSR prefix instruction.

Reference:

For the DSR prefix instruction, see “nX-U8/100 Core Instruction Manual”.

Clock Generation Circuit

6. Clock Generation Circuit

6.1 Overview

The clock generation circuit generates and provides a low-speed clock (LSCLK), 2× low-speed clock (LSCLK2), a high-speed clock (HSCLK), a system clock (SYSCLK), and a high-speed output clock (OUTCLK). LSCLK, LSCLK×2, and HSCLK are time base clocks for the peripheral circuits, SYSCLK is a basic operation clock of CPU, and OUTCLK is a clock that is output from a port.

For the OUTCLK output port, see Chapter 20, “Port 2”.

Additionally, for the STOP mode described in this chapter, see Chapter 4, “MCU Control Function”, and for BLD, see Chapter 28, “Battery Level Detection Circuit”.

6.1.1 Features

- Low-speed clock: 32.768 kHz crystal oscillation mode
 - Capable of generating $\text{LSCLK} \times 2$ (64 kHz) to be used for some peripherals.
- High-speed clock: Software selection
 - 500 kHz RC oscillation mode
 - Crystal/ceramic oscillation mode
 - Built-in PLL oscillation mode
 - External clock input mode

6.1.2 Configuration

Figure 6-1 shows the configuration of the clock generation circuit.

FCON0 : Frequency control register 0
FCON1 : Frequency control register 1

Figure 6-1 Configuration of Clock Generation Circuit

Note:

This LSI starts operation with a clock generated by dividing the 500 kHz RC oscillation frequency by 8 after power-on or a system reset. At initialization by software, set the FCON0 or FCON1 register to switch the clock to a required one. Operation of this LSI is not guaranteed under a condition where a low-speed clock is not supplied.

6.1.3 List of Pins

Pin name	I/O	Description
XT0	I	Pin for connecting a crystal for low-speed clock
XT1	O	Pin for connecting a crystal for low-speed clock
P10/OSC0	I	Pin for connecting a crystal/ceramic resonator for high-speed clock Used for the secondary function of the P10 pin
P11/OSC1	O	Pin for connecting a crystal/ceramic resonator for high-speed clock Used for the secondary function of the P11 pin

6.2 Description of Registers

6.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F002H	Frequency control register 0	FCON0	FCON	R/W	8/16	33H
0F003H	Frequency control register 1	FCON1		R/W	8	03H

6.2.2 Frequency Control Register 0 (FCON0)

Address: 0F002H

Access: R/W

Access size: 8/16 bits

Initial value: 33H

	7	6	5	4	3	2	1	0
FCON0	—	—	OUTC1	OUTC0	OSCM1	OSCM0	SYSC1	SYSC0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	1	1	0	0	1	1

FCON0 is a special function register (SFR) to control the high-speed clock generation circuit and to select system clock.

[Description of Bits]

- **SYSC1, SYSC0** (bits 1, 0)

The SYSC1 and SYSC0 bits are used to select the frequency of the high-speed clock (HCLK) used for system clock and peripheral circuits (including high-speed time base counter). OSCLK, 1/2OSCLK, 1/4OSCLK, or 1/8OSCLK can be selected. The maximum operating frequency guaranteed for the system clock (SYSCLK) of this LSI is 4.2 MHz.

At system reset, 1/8OSCLK is selected.

SYSC1	SYSC0	Description
0	0	OSCLK (1/2OSCLK in built-in PLL oscillation mode)
0	1	1/2OSCLK
1	0	1/4OSCLK
1	1	1/8OSCLK (initial value)

- **OSCM1, OSCM0** (bits 3, 2)

The OSCM1 and OSCM0 bits are used to select the mode of the high-speed clock generation circuit. RC oscillation mode, crystal/ceramic oscillation mode, PLL oscillation mode, or external clock input mode can be selected.

The setting of OSCM1 and OSCM0 can be changed only when high-speed oscillation is being stopped (ENOSC bit of FCON1 is "0"). At system reset, RC oscillation mode is selected.

- When switching the high-speed oscillation mode, please first switch back to low speed clock before switching to other high-speed clock (set the ENOSC bit and SYSCLK bit of FCON1 to "0").

OSCM1	OSCM0	Description
0	0	RC oscillation mode (initial value)
0	1	Crystal/ceramic oscillation mode
1	0	Built-in PLL oscillation mode
1	1	External clock input mode

- **OUTC1, OUTC0** (bits 5, 4)

The OUTC1 and OUTC0 bits are used to select the frequency of the high-speed output clock which is output when the secondary function of the port is used.

OSCLK, 1/2OSCLK, 1/4OSCLK, or 1/8OSCLK can be selected.

At system reset, 1/8OSCLK is selected.

OUTC1	OUTC0	Description
0	0	OSCLK
0	1	1/2OSCLK
1	0	1/4OSCLK
1	1	1/8OSCLK (initial value)

Note:

- To switch the mode of the high-speed clock generation circuit using the OSCM1 and OSCM0 bits, stop the high-speed oscillation and set the system clock to the low-speed clock (set the ENOSC bit and SYSCLK of FCON1 to “0”).
- The oscillators that are connected to the P10/OSC0 and P11/OSC1 pins must not exceed 4.2 MHz. In external clock mode, input a clock that does not exceed 4.2 MHz. When a built-in PLL oscillation mode is selected (OSCM1 = “1”, OSCM0 = “0”), 1/2OSCLK (about 4.096 MHz) is output as HSCLK even if OSCLK (SYSC0 = “0”, SYSC1 = “1”) is selected.
- When built-in PLL (about 8.192 MHz) oscillation mode is selected (OSCM1 = “1”, OSCM0 = “0”), 1/2OSCLK (about 4.096 MHz) is output as HSCLK even if OSCLK (SYSC0 = “0”, SYSC1 = “1”) is selected.

6.2.3 Frequency Control Register 1 (FCON1)

Address: 0F003H

Access: R/W

Access size: 8 bits

Initial value: 03H

	7	6	5	4	3	2	1	0
FCON1	LPLL	—	—	—	—	ENMLT	ENOSC	SYSCLK
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	1	1

FCON1 is a special function register (SFR) to control the high-speed clock generation circuit and to select system clock.

[Description of Bits]

- **SYSCLK** (bit 0)

The SYSCLK bit is used to select system clock. It allows selection of the low-speed clock (LSCLK) or HSCLK (1/nOSCLK: n = 1, 2, 4, 8) selected by using the high-speed clock frequency select bit (SYSC1, 0) of FCON0. When the oscillation of high-speed clock is stopped (ENOSC bit = "0"), the SYSCLK bit is fixed to "0" and the low-speed clock (LSCLK) is selected for system clock.

SYSCLK	Description
0	LSCLK
1	HSCLK (initial value)

- **ENOSC** (bit 1)

The ENOSC bit is used to select enable/disable of the oscillation of the high-speed clock oscillator.

ENOSC	Description
0	Disables high-speed oscillation
1	Enables high-speed oscillation (initial value)

- **ENMLT** (bit 2)

The ENMLT bit is used to select enable/disable of the operation of the 2× low-speed clock (LSCLK×2).

ENMLT	Description
0	Disables 2× low-speed clock operation (initial value)
1	Enables 2× low-speed clock operation

- **LPLL** (bit 7)

The LPLL bit is used as a flag to indicate the oscillation state of PLL oscillation.

When the LPLL bit is set to "1", this indicates that the PLL oscillation frequency is locked within 8.192 MHz±2.5%. When the LPLL bit is set to "0", this indicates that the PLL oscillation is inactive or the PLL oscillation frequency is not within 8.192 MHz±2.5%.

LPLL is a read-only bit.

LPLL	Description
0	Disables the use of PLL oscillation (initial value)
1	Enables the use of PLL oscillation

6.3 Description of Operation

6.3.1 Low-Speed Clock

6.3.1.1 Low-Speed Clock Generation Circuit

Figure 6-2 shows the configuration of the low-speed clock generation circuit.

A low-speed clock generation circuit is provided with an external 32.768 kHz crystal. To match the oscillation frequency by using a trimmer capacitor, connect external capacitors (C_{GL} and C_{DL}) as required.

In STOP mode, V_{DDX} is powered off to stop low-speed oscillation, and the XT0 and XT1 pins become Hiz (Hi Impedance state).

When the ENMLT bit of FCON1 is set to "1", the 2× low-speed clock circuit starts to generate the LSCLK×2(64kHz)

Figure 6-2 Circuit Configuration of 32.768 kHz Crystal Oscillation Mode

Notes:

- Install a crystal as close to the LSI as possible and make sure that signals causing noise and power supply wiring are not near the crystal and its wiring.
- Note that oscillation may stop due to condensation.

6.3.1.2 Operation of Low-Speed Clock Generation Circuit

The low-speed clock generation circuit is activated by the occurrence of power ON reset.

A low-speed clock (LSCLK) is supplied to the peripheral circuits after the elapse of the low-speed oscillation start period (T_{XTL}) and oscillation stabilization period (8192 counts) after powered on.

The low-speed clock generation circuit stops the oscillation in STOP mode. When oscillation is resumed by releasing of the STOP mode by external interrupt, LSCLK is supplied to the peripheral circuits after the elapse of the low-speed oscillation start period (T_{XTL}) and low-speed clock (LSCLK) oscillation stabilization period. For STOP mode, see Chapter 4, "MCU Control Function".

Figure 6-3 shows the waveforms of the low-speed clock generation circuit. For the low-speed oscillation start time (T_{XTL}), see Appendix C, "Electrical Characteristics".

Figure 6-3 Operation of Low-Speed Clock Generation Circuit

Note:

After the power supply is turned on, CPU starts operation with a high-speed clock (500 kHz RC oscillation). It is recommended to switch to the low-speed clock after confirming that the low-speed clock is oscillating by checking that the 128 Hz interrupt request bit (Q128H) of the low-speed time base counter is "1". If the clock is switched before the low-speed clock oscillates, the CPU stops operation until oscillation of the low-speed clock starts.

6.3.2 High-Speed Clock

Setting of the OSCM1 and OSCM0 bits of the frequency control register 0 (FCON0) allows selection of the 500 kHz RC oscillation mode, crista/ceramic oscillation mode, built-in PLL (Phase Locked Loop) oscillation mode, or external clock input mode for the high-speed clock generation circuit.

6.3.2.1 500 kHz RC Oscillation

In RC oscillation mode (OSCM0 = "0", OSCM1 = "0"), supply of OSCLK (high-speed oscillation clock) is started when RC oscillation clock pulse count reaches 128 after oscillation is enabled (ENOSC is set to "1").

In 500 kHz RC oscillation mode, both the P10/OSC0 pin and the P11/OSC1 pin can be used as general-purpose input ports.

Figure 6-4 shows the circuit configuration in RC oscillation mode.

Figure 6-4 Circuit Configuration in RC Oscillation Mode

Notes:

- The RC oscillation mode is allowed within the range of $V_{DD} = 1.3 \text{ V}$ to 3.6 V .
- After system reset mode is released, supply of OSCLK starts after the RC oscillation clock pulse count reaches 8192. After release of a STOP mode, supply of OSCLK starts.

6.3.2.2 Crystal/Ceramic Oscillation Mode

In crystal/ceramic oscillation mode, both the P10/OSC0 pin and the P11/OSC1 pin are used for crystal ceramic oscillation.

In crystal/ceramic oscillation mode, a crystal or a ceramic resonator is externally connected to the P10/OSC0 and P11/OSC1 pins. If the high-speed oscillation clock pulse count reaches 4096 after oscillation enable, the clock is output to OSCLK (high-speed oscillation clock).

Figure 6-5 shows the circuit configuration in crystal/ceramic oscillation mode.

Figure 6-5 Circuit Configuration in Crystal/Ceramic Oscillation Mode

Notes:

- The crystal/ceramic oscillation mode can be used within a V_{DD} range of 1.8 V to 3.6 V. Select a frequency according to the operating voltage range by using the power supply voltage detection circuit (BLD). See Chapter 28, “Battery Level Detection Circuit” for details of BLD.
- Install a crystal or a ceramic resonator as close to the LSI as possible and make sure that signals causing noise and power supply wiring are not near the crystal or the ceramic resonator and their wiring.
- Note that oscillation may stop due to condensation.
- The crystal or the ceramic resonator connected to the P10/OSC0 and P11/OSC1 pins should not exceed the guaranteed maximum operation frequency of 4.2 MHz of the system clock (SYSCLK) of this LSI.

6.3.2.3 Built-in PLL Oscillation Mode

The PLL oscillation circuit generates a clock of 8.192 MHz ($= 32.768 \text{ kHz} \times 250$) $\pm 2.5\%$. When the PLL oscillation clock (OSCLK) reaches within 8.192 MHz $\pm 2.5\%$, the LPLL flag of FCON1 is set.

In built-in PLL oscillation mode (OSCM0 = "0", OSCM1 = "1"), supply of OSCLK (high-speed oscillation clock) is started when PLL oscillation clock pulse count reaches 4096 after oscillation is enabled (ENOSC is set to "1").

In PLL oscillation mode, both the P10/OSC0 pin and the P11/OSC1 pin can be used as general-purpose input ports.

Figure 6-6 shows the circuit configuration in PLL oscillation mode.

Figure 6-6 Circuit Configuration in PLL Oscillation Mode

Note:

The PLL oscillation mode can be used within a V_{DD} range of 1.8 V to 3.6 V. Select a frequency according to the operating voltage range by using the power supply voltage detection circuit (BLD).

When OSCLK is selected through SYSC1 or SYSC0 of FCON0 in PLL oscillation mode, about 4.096MHz, which is the same as $1/2\text{OSCLK}$, is selected.

To use a PLL oscillation mode, a frequency of low-speed crystal oscillation 32.768kHz is necessary. The frequency of 32.768kHz is not adjusted by the frequency adjustment circuit of the time base counter.

6.3.2.4 External Clock Input Mode

In external clock input mode, external clock is input from the P10/OSC0 pin. The P11/OSC1 pin can be used as a general-purpose input port.

Figure 6-7 shows the circuit configuration in external clock input mode.

Figure 6-7 Circuit Configuration in External Clock Input Mode

Notes:

- The external clock input mode can be used within a V_{DD} range of 1.8 V to 3.6 V. Select a frequency according to the operation voltage range by using the power supply voltage detection circuit (BLD).
- Since the diodes are included between the P10/OSC0 pin and V_{DD} and between the P10/OSC0 pin and V_{SS} , do not apply voltages higher than V_{DD} and lower than V_{SS} to the P10/OSC0 pin.
- If the P10/OSC0 pin is left open in external clock input mode, excessive current can flow. Therefore, make sure that the "H" level (V_{DD}) or the "L" level (V_{SS}) is input.
- The clock that is input should not exceed the guaranteed maximum operating frequency 4.2 MHz of the system clock (SYSCCLK) of this LSI.

6.3.2.5 Operation of High-Speed Clock Generation Circuit

The high-speed clock generation circuit is activated in 500Hz RC oscillation mode by power-on reset generation.

As a result of the occurrence of power-on reset, the circuit goes into system reset mode and then shifts to program operating mode after the elapse of the high-speed RC oscillation start time (T_{RC}) and the oscillation stabilization time (Count: 8192) of the high-speed oscillation clock (OSCLK) and at the same time, a high-speed clock (HSCLK) is supplied to the peripheral circuits.

Figure 6-8 shows the waveforms of the high-speed clock generation circuit at power on. For the high-speed RC oscillation start time (T_{RC}), see Appendix C, "Electrical Characteristics".

Figure 6-8 Operation of High-Speed Clock Generation Circuit at Power-On

The high-speed clock generation circuit allows selection of an oscillation mode and start/stop of oscillation by using the frequency control registers 0 and 1 (FCON0 and FCON1).

Oscillation can be started by setting the ENOSC bit to "1" after selecting a high-speed oscillation mode in FCON0 and a high-speed oscillation frequency. After the start of oscillation, HSCLK starts supply of a clock to the peripheral circuits following the elapse of the high-speed oscillation start period ($T_{RC}/T_{XTH}/T_{PLL}$) in each mode and the oscillation stabilization period of the high-speed oscillation clock (OSCLK).

The high-speed clock generation circuit stops oscillation when it shifts to a STOP mode by the software. When the STOP mode is released by external interrupt, HSCLK supplies clocks to peripheral circuits following the elapse of the high-speed oscillation start period ($T_{RC}/T_{XTH}/T_{PLL}$) in each mode and the oscillation stabilization period of the high-speed clock (OSCLK). The oscillation stabilization period is the duration of 128 clock pulses in 500 kHz RC oscillation mode and external clock input mode and the duration of 4096 clock pulses in the crystal/ceramic oscillation mode and PLL oscillation mode.

Figure 6-9 shows the waveforms of the high-speed clock generation circuit in crystal/ceramic oscillation mode.

Figure 6-9 Operation of High-Speed Clock Generation Circuit in Crystal/Ceramic Oscillation Mode

6.3.3 Switching of System Clock

The system clock can be switched between high-speed clock (HSCLK) and low-speed clock (LSCLK) by using the frequency control registers (FCON0, FCON1).

Figure 6-10 shows a flow of system clock switching processing (HSCLK→LSCLK) and Figure 6-11 shows a flow of system clock switching processing (LSCLK→HSCLK).

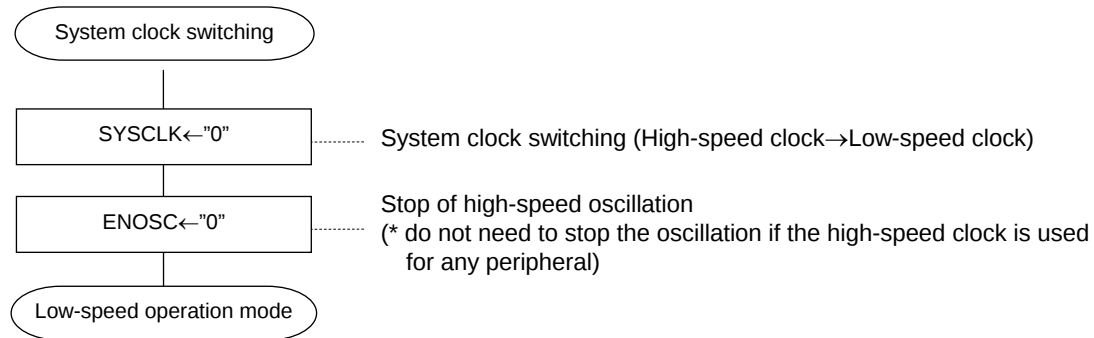

Figure 6-10 Flow of System Clock Switching Processing (HSCLK→LSCLK)

Note:

After the power is turned on or if the system clock is switched from HSCLK to LSCLK immediately following return from the STOP mode, the CPU becomes inactive until LSCLK starts clock supply to the peripheral circuits. Therefore, It is recommended to switch to LSCLK after confirming that the LSCLK is oscillating by checking that the time base counter interrupt request bit (Q128H) is "1".

Figure 6-11 Flow of System Clock Switching Processing (LSCLK→HSCLK)

Note:

If the system clock is switched from a low-speed clock to a high-speed clock before the high-speed clock (HSCLK) starts oscillation, the CPU becomes inactive until HSCLK starts clock supply to the peripheral circuits.

6.4 Specifying port registers

When you want to make sure clock output functions are working, please check related port registers are specified. See Chapter 20, "Port2" for detail about the port registers.

6.4.1 Functioning P21 (OUTCLK) as the high speed clock output

Set P21MD bit (bit1 of P2MOD register) to "1" for specifying the high speed clock output as the secondary function of P21.

Reg. name	P2MOD register (Address: 0F214H)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	P22MD	P21MD	P20MD
Data	-	-	-	-	-	*	1	*

Set P21C1 bit (bit1 of P2CON1 register) to "1" and set P21C0 bit(bit1 of P2CON0 register) to "1", for specifying the P21 as CMOS output.

Reg. name	P2CON1 register (Address: 0F213H)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	P22C1	P21C1	P20C1
Data	-	-	-	-	-	*	1	*

Reg. name	P2CON0 register (Address: 0F212H)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	P22C0	P21C0	P20C0
Data	-	-	-	-	-	*	1	*

Data of P21D bit (bit1 of P2D register) does not affect to the high speed clock output function, so don't care the data for the function.

Reg. name	P2D register (Address: 0F210H)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	P22D	P21D	P20D
Data	-	-	-	-	-	*	**	*

- : Bit does not exist.

* : Bit not related to the high speed clock function

** : Don't care the data.

Note:

P21(Port2) is an output-only port, does not have an register to select the data direction(input or output).

6.4.2 Functioning P20 (LSCLK) as the low speed clock output

Set P20MD bit (bit0 of P2MOD register) to “1” for specifying the low speed clock output as the secondary function of P22.

Reg. name	P2MOD register (Address: 0F214H)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	P22MD	P21MD	P20MD
Data	-	-	-	-	-	*	*	1

Set P20C1 bit (bit0 of P2CON1 register) to “1” and P20C0 bit (bit0 of P2CON0 register), for specifying P20 as CMOS output.

Reg. name	P2CON1 register (Address: 0F213H)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	P22C1	P21C1	P20C1
Data	-	-	-	-	-	*	*	1

Reg. name	P2CON0 register (Address: 0F212H)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	P22C0	P21C0	P20C0
Data	-	-	-	-	-	*	*	1

Data of P20D bit (bit0 of P2D register) does not affect to the low speed clock output function, so don't care the data for the function.

Reg. name	P2D register (Address: 0F210H)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	P22D	P21D	P20D
Data	-	-	-	-	-	*	*	**

- : Bit does not exist.

* : Bit not related to the low speed clock function

** : Don't care the data.

Note:

P20(Port2) is an output-only port, does not have an register to select the data direction(i.e. input or output).

Time Base Counter

7. Time Base Counter

7.1 Overview

This LSI includes a low-speed time base counter (LTBC) and a high-speed time base counter (HTBC) that generate base clocks for peripheral circuits. By using the time base counter, it is possible to generate events periodically. For input clocks, see Chapter 6, “Clock Generation Circuit”. For interrupt permission, interrupt request flags, etc., described in this chapter, see Chapter 5, “Interrupts”.

7.1.1 Features

- LTBC generates T32KHZ to T1HZ signals by dividing the low-speed clock (LSCLK) frequency.
- LTBC allows frequency adjustment (Adjustment range: Approx. -488ppm to +488ppm. Adjustment accuracy: Approx. 0.48ppm) by using the low-speed time base counter frequency adjustment registers (LTBADJH and LTBADJL).
- HTBC generates HTB1 to HTB32 signals by dividing the high-speed clock (HSCLK) frequency.
- Capable of generating 128Hz , 32Hz , 16Hz , and 2Hz interrupts.

7.1.2 Configuration

Figure 7-1 and Figure 7-2 show the configuration of a low-speed time base counter and a high-speed time base counter, respectively.

Figure 7-1 Configuration of Low-Speed Time Base Counter (LTBC)

Figure 7-2 Configuration of High-Speed Time Base Counter

Note:

The frequency of HSCLK changes according to specified data in SYSC1 bit and SYSC0 bit of Frequency control register 0 (FON0)

7.2 Description of Registers

7.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F00AH	Low-speed time base counter register	LTBR	—	R/W	8	00H
0F00BH	High-speed time base counter frequency divide register	HTBDR	—	R/W	8	00H
0F00CH	Low-speed time base counter frequency adjustment register L	LTBADJL	LTBADJ	R/W	8/16	00H
0F00DH	Low-speed time base counter frequency adjustment register H	LTBADJH		R/W	8	00H

7.2.2 Low-Speed Time Base Counter (LTBR)

Address: 0F00AH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
LTBR	T1HZ	T2HZ	T4HZ	T8HZ	T16HZ	T32HZ	T64HZ	T128HZ
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

LTBR is a special function register (SFR) to read the T128HZ-T1HZ outputs of the low-speed time base counter. The T128HZ-T1HZ outputs are set to “0” when write operation is performed for LTBR.

Note:

A TBC interrupt (128Hz interrupt, 32Hz interrupt, 16Hz interrupt, or 2Hz interrupt) may occur depending on the LTBR write timing (see Figure 7-4, “Interrupt Timing and Reset Timing by Writing to LTBR”). Therefore, take care in software programming. In addition, if LTBR is reset by writing to it for the purpose of adjusting the time of the real time clock (RTC), the real time clock may be faster by one second. When using the RTC, see Chapter 8, “Real Time Clock”.

7.2.3 High-Speed Time Base Counter Divide Register (HTBDR)

Address: 0F00BH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
HTBDR	—	—	—	—	HTD3	HTD2	HTD1	HTD0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

HTBDR is a special function register (SFR) to set the divide ratio of the 4-bit, 1/n counter.

[Description of Bits]

- **HTD3-HTD0** (bits 3-0)

The HTD3-HTD0 bits are used to set the frequency divide ratio of the 4-bit, 1/n counter. The frequency divide ratios selectable include 1/1 to 1/16.

HTD3	HTD2	HTD1	HTD0	Description	
				Divide ratio	Frequency of HTBCLK (*1)
0	0	0	0	$\times 1/16$ (initial value)	256 kHz
0	0	0	1	$\times 1/15$	273 kHz
0	0	1	0	$\times 1/14$	293 kHz
0	0	1	1	$\times 1/13$	315 kHz
0	1	0	0	$\times 1/12$	341 kHz
0	1	0	1	$\times 1/11$	372 kHz
0	1	1	0	$\times 1/10$	410 kHz
0	1	1	1	$\times 1/9$	455 kHz
1	0	0	0	$\times 1/8$	512 kHz
1	0	0	1	$\times 1/7$	585 kHz
1	0	1	0	$\times 1/6$	683 kHz
1	0	1	1	$\times 1/5$	819 kHz
1	1	0	0	$\times 1/4$	1024 kHz
1	1	0	1	$\times 1/3$	1365 kHz
1	1	1	0	$\times 1/2$	2048 kHz
1	1	1	1	$\times 1/1$	4096 kHz

*1: Indicates the frequency when the high-speed oscillation clock, HSCLK, is 4096 kHz.

7.2.4 Low-Speed Time Base Counter Frequency Adjustment Registers L and H (LTBADJL, LTBADJH)

Address: 0F00CH

Access: R/W

Access size: 8/16 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
LTBADJL	LADJ7	LADJ6	LADJ5	LADJ4	LADJ3	LADJ2	LADJ1	LADJ0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

Address: 0F00DH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
LTBADJH	—	—	—	—	—	LADJS	LADJ9	LADJ8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

LTBADJL and LTBADJH are special function registers (SFRs) to set the frequency adjustment values of the low-speed time base clock.

[Description of Bits]

- **LADJS, LADJ9-LADJ8** (bits 2-0) **LADJ7-LADJ0** (bits 7-0)

The LADJS and LADJ9 to LADJ0 bits are used to adjust frequency.

Adjustment range: Approx. -488ppm to +488ppm.

Adjustment accuracy: Approx. 0.48ppm

See Section 7.3.3, "Low-Speed Time Base Counter Frequency Adjustment Function" for the correspondence between the frequency adjustment values (LTBADJH, LTBADJL) and adjustment ratio.

7.3 Description of Operation

7.3.1 Low-Speed Time Base Counter

The low-speed time base counter (LTBC) starts counting from 0000H on the LSCLK falling edge after system reset. The T128HZ, T32HZ, T16HZ, and T2HZ outputs of LTBC are used as time base interrupts and an interrupt is requested on the falling edge of each output. Each of LTBC outputs is also used as an operation clock for peripheral circuits.

The output data of T128HZ to T1HZ of LTBC can be read from the low-speed time base counter register (LTBR). When reading the data, read LTBR twice and check that the two values coincide to prevent reading of undefined data during counting.

Figure 7-3 shows an example of program to read LTBR.

```

MARK:    LEA    offset LTBR    ; EA←LTBR address
        L      R0,    [EA]    ; 1st read
        L      R1,    [EA]    ; 2nd read
;
        CMP    R0,    R1      ; Comparison for LTBR
        BNE    MARK        ; To MARK when the values do not coincide
;
        :

```

Figure 7-3 Programming Example for Reading LTBR

LTBR is reset when write operation is performed and the T128HZ to T1HZ outputs are set to “0”. Write data is invalid. Since an interrupt occurs if a falling edge occurs in the T128Hz to T1Hz outputs during writing to LTBR, take care in software programming. In addition, if LTBR is reset by writing to it for the purpose of adjusting the time of the real time clock (RTC), the real time clock may be faster by one second. When using the RTC, see Chapter 8, “Real Time Clock”.

Figure 7-4 shows interrupt generation timing and reset timing of the time base counter output by writing to LTBR.

Figure 7-4 Interrupt Timing and Reset Timing by Writing to LTBR

7.3.2 High-Speed Time Base Counter

The high-speed time base counter is configured as a 4-bit 1/n counter ($n = 1$ to 16).

In the 4-bit 1/n counter, the divided clock ($1/16 \times \text{HSCLK}$ to $1/1 \times \text{HSCLK}$) selected by the high-speed time base counter divide register (HTBDR) is generated as HTBCLK. HTBCLK is used as a timer and also as an operation clock of PWM.

Figure 7-5 shows the output waveform of HTBCLK.

Figure 7-5 Output Waveform of HTBCLK

7.3.3 Low-Speed Time Base Counter Frequency Adjustment Function

Frequency adjustment (Adjustment range: Approx. -488ppm to +488ppm. Adjustment accuracy: Approx. 0.48ppm) is possible for outputs of T8KHZ to T1HZ of LTBC by using the low-speed time base counter frequency adjust registers (LTBADJH and LTBADJL).

Table7-1 shows correspondence between the frequency adjustment values (LTBADJH, LTBADJL) and adjustment ratio.

Table 7-1 Correspondence between Frequency Adjustment Values (LTBADJH, LTBADJL) and Adjustment Ratio

LADJ10 to 0										Hexadecimal	Frequency adjustment ratio (ppm)
0	1	1	1	1	1	1	1	1	1	3FFH	+487.80
0	1	1	1	1	1	1	1	1	0	3FEH	+487.33
:	:	:	:	:	:	:	:	:	:	:	:
0	0	0	0	0	0	0	0	0	1	003H	+1.43
0	0	0	0	0	0	0	0	0	0	002H	+0.95
0	0	0	0	0	0	0	0	0	0	001H	+0.48
0	0	0	0	0	0	0	0	0	0	000H	0
1	1	1	1	1	1	1	1	1	1	7FFH	-0.48
1	1	1	1	1	1	1	1	1	0	7FEH	-0.95
:	:	:	:	:	:	:	:	:	:	:	:
1	0	0	0	0	0	0	0	0	0	401H	-487.80
1	0	0	0	0	0	0	0	0	0	400H	-488.28

The adjustment values (LADJ10 to LADJ0) to be set in LTBADJH and LTBADJL can be obtained by using the following equations:

$$\begin{aligned}\text{Adjustment value} &= \text{Frequency adjustment ratio} \times 2097152 \text{ (decimal)} \\ &= \text{Frequency adjustment ratio} \times 200000h \text{ (hexadecimal)}\end{aligned}$$

Example 1: When adjusting +15.0ppm (gaining time)

$$\begin{aligned}\text{Adjustment value} &= +15.0\text{ppm} \times 2097152 \text{ (decimal)} \\ &= +15.0 \times 10^{-6} \times 2097152 \\ &= +31.45728 \text{ (decimal)} \\ &\cong 01Fh \text{ (hexadecimal)}\end{aligned}$$

Example 2: When adjusting -25.5ppm (losing time)

$$\begin{aligned}\text{Adjustment value} &= -25.5\text{ppm} \times 2097152 \text{ (decimal)} \\ &= -25.5 \times 10^{-6} \times 2097152 \\ &= -53.477376 \text{ (decimal)} \\ &\cong 7CCh \text{ (hexadecimal)}\end{aligned}$$

Note:

The low-speed clock (LSCLK) and the outputs of T32KHZ and T16KHZ of LTBC are not adjusted by the frequency adjust function.

The frequency adjustment accuracy does not guarantee the accuracy including the frequency variation of the crystal oscillation (32.768kHz) due to temperature variations.

Chapter 8

Real Time Clock

8. Real Time Clock

8.1 Overview

This LSI includes a real time clock (RTC).

For input clocks, see Chapter 7, “Time Base Counter”. For interrupt permission, interrupt request flags, etc., described in this chapter, see Chapter 5, “Interrupts”.

8.1.1 Features

- Date counting function including year, month, day, and day of the week and clock counting function including hour, minute, and second
- Auto calendar function with leap year checking function
- Periodic interrupt function with selection range of 0.5 seconds, 1 second, and 1 minute
- Alarm interrupt function according to coincidence of day of the week, hour, and minute
- Alarm interrupt function according to coincidence of month, day, hour, and minute

8.1.2 Configuration

Figure 8-1 shows the configuration of the real time clock.

RTCCON: Real time clock control register

Figure 8-1 Configuration of Real Time Clock

8.2 Description of Registers

8.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F0C0H	Real time clock second register	RTCSEC	—	R/W	8	Undefined
0F0C1H	Real time clock minute register	RTCMIN	—	R/W	8	Undefined
0F0C2H	Real time clock hour register	RTCHOUR	—	R/W	8	Undefined
0F0C3H	Real time clock week register	RTCWEEK	—	R/W	8	Undefined
0F0C4H	Real time clock day register	RTCDAY	—	R/W	8	Undefined
0F0C5H	Real time clock month register	RTCMON	—	R/W	8	Undefined
0F0C6H	Real time clock year register	RTCYEAR	—	R/W	8	Undefined
0F0C7H	Real time clock control register	RTCCON	—	R/W	8	00H
0F0C8H	Real time clock alarm 0 minute register	AL0MIN	—	R/W	8	00H
0F0C9H	Real time clock alarm 0 hour register	AL0HOUR	—	R/W	8	00H
0F0CAH	Real time clock alarm 0 week register	AL0WEEK	—	R/W	8	00H
0F0CBH	Real time clock alarm 1 minute register	AL1MIN	—	R/W	8	00H
0F0CCH	Real time clock alarm 1 hour register	AL1HOUR	—	R/W	8	00H
0F0CDH	Real time clock alarm 1 day register	AL1DAY	—	R/W	8	00H
0F0CEH	Real time clock alarm 1 month register	AL1MON	—	R/W	8	00H

8.2.2 Real Time Clock Second Register (RTCSEC)

Address: 0F0C0H

Access: R/W

Access size: 8 bits

Initial value: Undefined

	7	6	5	4	3	2	1	0
RTCSEC	—	RS6	RS5	RS4	RS3	RS2	RS1	RS0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	x	x	x	x	x	x	x	x

RTCSEC is a special function register (SFR) to store decimal second data.

[Description of Bits]

- **RS6-RS0** (bits 6-0)

The RS6 to RS0 bits are used to store decimal second data (00 to 59). During RTC operation, RTCSEC increments on the rising edge of the T1Hz signal of the low-speed time base counter (LTBC).

Note:

When setting second data in RTCSEC, stop RTC (RTCEN=0).

Do not write unrealistic second data to RTCSEC.

When reading RTCSEC, read consecutively it twice until the last data coincides the previous data to prevent reading of uncertain data while counting up the clock.

8.2.3 Real Time Clock Minute Register (RTCMIN)

Address: 0F0C1H

Access: R/W

Access size: 8 bits

Initial value: Undefined

	7	6	5	4	3	2	1	0
RTCMIN	—	RM6	RM5	RM4	RM3	RM2	RM1	RM0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	x	x	x	x	x	x	x	x

RTCMIN is a special function register (SFR) to store decimal minute data.

[Description of Bits]

- **RM6-RM0** (bits 6-0)

The RM6 to RM0 bits are used to store decimal minute data (00 to 59). RTCMIN increments at occurrence of carry from RTCSEC (Second: 59→00).

Note:

When setting minute data in RTCMIN, stop RTC (RTCEN=0).

Do not write unrealistic minute data to RTCMIN.

When reading RTCMIN, read consecutively it twice until the last data coincides the previous data to prevent reading of uncertain data while counting up the clock.

8.2.4 Real Time Clock Hour Register (RTCHOUR)

Address: 0F0C2H

Access: R/W

Access size: 8 bits

Initial value: Undefined

	7	6	5	4	3	2	1	0
RTCHOUR	—	—	RH5	RH4	RH3	RH2	RH1	RH0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	x	x	x	x	x	x	x	x

RTCHOUR is a special function register (SFR) to store decimal hour data.

[Description of Bits]

- **RH5-RH0** (bits 5-0)

The RH5 to RH0 bits are used to store decimal hour data (00 to 23). RTCHOUR increments at occurrence of carry from RTCMIN (Minute: 59→00).

Note:

When setting hour data in RTCHOUR, stop RTC (RTCEN=0).

Do not write unrealistic hour data to RTCHOUR.

When reading RTCHOUR, read consecutively it twice until the last data coincides the previous data to prevent reading of uncertain data while counting up the clock.

8.2.5 Real Time Clock Week Register (RTCWEEK)

Address: 0F0C3H

Access: R/W

Access size: 8 bits

Initial value: Undefined

	7	6	5	4	3	2	1	0
RTCWEEK	—	—	—	—	—	RW2	RW1	RW0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	x	x	x	x	x	x	x	x

RTCWEEK is a special function register (SFR) to store decimal day-of-the-week data.

[Description of Bits]

- **RW2-RW0** (bits 2-0)

The RW2 to RW0 bits are used to store decimal day-of-the-week data (01 to 07). RTCWEEK is incremented at occurrence of carry from RTCHOUR (Hour: 23→00). Day-of-the-week data can be associated with any actual day of the week since their relation is not fixed.

Note:

When setting day-of-the-week data in RTCWEEK, stop RTC (RTCEN=0).

Do not write unrealistic day-of-the-week data to RTCWEEK.

When reading RTCWEEK, read consecutively it twice until the last data coincides the previous data to prevent reading of uncertain data while counting up the clock.

8.2.6 Real Time Clock Day Register (RTCDAV)

Address: 0F0C4H

Access: R/W

Access size: 8 bits

Initial value: Undefined

	7	6	5	4	3	2	1	0
RTCDAV	—	—	RD5	RD4	RD3	RD2	RD1	RD0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	x	x	x	x	x	x	x	x

RTCDAV is a special function register (SFR) to store decimal day data.

[Description of Bits]

- **RD5-RD0** (bits 5-0)

The RD5 to RD0 bits are used to store decimal day data (01 to 31). RTCDAV increments at occurrence of carry from RTCHOUR (Hour: 23→00).

Note:

When setting day data in RTCDAV, stop RTC (RTCEN=0).

Do not write unrealistic day data to RTCDAV.

When reading RTCDAV, read consecutively it twice until the last data coincides the previous data to prevent reading of uncertain data while counting up the clock.

8.2.7 Real Time Clock Month Register (RTCMON)

Address: 0F0C5H

Access: R/W

Access size: 8 bits

Initial value: Undefined

	7	6	5	4	3	2	1	0
RTCMON	—	—	—	RMO4	RMO3	RMO2	RMO1	RMO0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	x	x	x	x	x	x	x	x

RTCMON is a special function register (SFR) to store decimal month data.

[Description of Bits]

- **RMO4-RMO0** (bits 4-0)

The RMO4 to RMO0 bits are used to store decimal month data (01 to 12). RTCMON increments at occurrence of carry from RTCDAY (Day: 28/30/31→01).

Note:

When setting month data in RTCMON, stop RTC (RTCEN=0).

Do not write unrealistic month data to RTCMON.

When reading RTCMON, read consecutively it twice until the last data coincides the previous data to prevent reading of uncertain data while counting up the clock.

8.2.8 Real Time Clock Year Register (RTCYEAR)

Address: 0F0C6H

Access: R/W

Access size: 8 bits

Initial value: Undefined

	7	6	5	4	3	2	1	0
RTCYEAR	RY7	RY6	RY5	RY4	RY3	RY2	RY1	RY0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	x	x	x	x	x	x	x	x

RTCYEAR is a special function register (SFR) to store decimal year data.

[Description of Bits]

- **RY7-RY0** (bits 7-0)

The RY7 to RY0 bits are used to store decimal year data (00 to 99). RTCYEAR increments at occurrence of carry from RTCMON (Month: 12→01).

Note:

When setting month data in RTCYEAR, stop RTC (RTCEN=0).

Do not write unrealistic year data to RTCYEAR.

When reading RTCYEAR, read consecutively it twice until the last data coincides the previous data to prevent reading of uncertain data while counting up the clock.

8.2.9 Real Time Clock Control Register (RTCCON)

Address: 0F0C7H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
RTCCON	—	—	—	—	—	RIN1	RIN0	RTCEN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

RTCCON is a special function register (SFR) to control the real time clock.

[Description of Bits]

- **RTCEN** (bit 0)

RTCEN is a bit to control the operation start/stop of the RTC.

RTCEN	Description
0	Stops RTC operation (initial value).
1	Starts RTC operation.

- **RIN1-RIN0** (bits 2-1)

Bits RIN1 to RIN0 are used to control a periodic interrupt. These bits allow selection of periodic interrupt prohibition, 0.5-second interrupt permission, 1-second interrupt permission, and 1-minute interrupt permission.

RIN1	RIN0	Description
0	0	Prohibits periodic interrupts (initial value).
0	1	Permits 0.5-second interrupts.
1	0	Permits 1-second interrupts.
1	1	Permits 1-minute interrupts.

Note:

A 0.5-second interrupt and a 1-second interrupt request a RTC periodic interrupt (RTCINT) even if RTC is being stopped (RTCEN is "0"). A 1-minute interrupt does not request a RTC periodic interrupt while RTC is stopped.

8.2.10 Real Time Clock Alarm 0 Minute Register (AL0MIN)

Address: 0F0C8H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
AL0MIN	—	AL0M6	AL0M5	AL0M4	AL0M3	AL0M2	AL0M1	AL0M0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

AL0MIN is a special function register (SFR) to set an alarm 0 interrupt time..

Set minute data in AL0MIN for generation of an alarm.

[Description of Bits]

- **AL0M6-AL0M0** (bits 6-0)

The AL0M6 to AL0M0 bits are used to store decimal minute data (00 to 59) for generation of an alarm.

Note:

Setting an unrealistic time in AL0MIN does not generate an alarm 0 interrupt (AL0INT).

8.2.11 Real Time Clock Alarm 0 Hour Register (AL0HOUR)

Address: 0F0C9H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
AL0HOUR	—	—	AL0H5	AL0H4	AL0H3	AL0H2	AL0H1	AL0H0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

AL0HOUR is a special function register (SFR) to set an alarm 0 interrupt time..
Set hour data in AL0HOUR.

[Description of Bits]

- **AL0H5-AL0H0** (bits 5-0)

The AL0H5 to AL0H0 bits are used to store decimal hour data (00 to 23) for generation of an alarm.

Note:

Setting an unrealistic time in AL0HOUR does not generate an alarm 0 interrupt (AL0INT).

8.2.12 Real Time Clock Alarm 0 Week Register (ALOWEEK)

Address: 0F0CAH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
ALOWEEK	—	—	—	—	—	ALOW2	ALOW1	ALOW0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

ALOWEEK is a special function register (SFR) to set an alarm 0 interrupt time..

Set day-of-the-week data in ALOWEEK.

[Description of Bits]

- **ALOW2-ALOW0** (bits 2-0)

The ALOW2 to ALOW0 bits are used to store decimal hour data (00 to 07) for generation of an alarm.

Note:

When ALOWEEK is not used as comparison data for generating an alarm, set ALOWEEK to “00H”.

8.2.13 Real Time Clock Alarm 1 Minute Register (AL1MIN)

Address: 0F0CBH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
AL1MIN	—	AL1M6	AL1M5	AL1M4	AL1M3	AL1M2	AL1M1	AL1M0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

AL1MIN is a special function register (SFR) to set an alarm 1 interrupt time..

Set minute data in AL1MIN for generation of an alarm.

[Description of Bits]

- **AL1M6-AL1M0** (bits 6-0)

The AL1M6 to AL1M0 bits are used to store decimal minute data (00 to 59) for generation of an alarm.

The AL1M6 to AL1M0 bits are set to “0” at system reset.

Note:

Setting an unrealistic time in AL1MIN does not generate an alarm 1 interrupt (AL1INT).

8.2.14 Real Time Clock Alarm 1 Hour Register (AL1HOUR)

Address: 0F0CCH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
AL1HOUR	—	—	AL1H5	AL1H4	AL1H3	AL1H2	AL1H1	AL1H0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

AL1HOUR is a special function register (SFR) to set an alarm 1 interrupt time..

Set hour data in AL1HOUR for generation of an alarm.

[Description of Bits]

- **AL1H5-AL1H0** (bits 5-0)

The AL1H5 to AL1H0 bits are used to store decimal hour data (00 to 23) for generation of an alarm.

Note:

Setting an unrealistic time in AL1HOUR does not generate an alarm 1 interrupt (AL1INT).

8.2.15 Real Time Clock Alarm 1 Day Register (AL1DAY)

Address: 0F0CDH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
AL1DAY	—	—	AL1D5	AL1D4	AL1D3	AL1D2	AL1D1	AL1D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

AL1DAY is a special function register (SFR) to set an alarm 1 interrupt time..

Set day data in AL1DAY for generation of an alarm.

[Description of Bits]

- **AL1D5-AL1D0** (bits 5-0)

The AL1D5 to AL1D0 bits are used to store decimal day data (01 to 31) for generation of an alarm.

Note:

Setting an unrealistic value for day in AL1DAY does not generate an alarm 1 interrupt (AL1INT).

When AL1DAY is not used as comparison data for generating an alarm, set AL1DAY to "00H".

8.2.16 Real Time Clock Alarm 1 Month Register (AL1MON)

Address: 0F0CEH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
AL1MON	—	—	—	AL1MO4	AL1MO3	AL1MO2	AL1MO1	AL1MO0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

AL1MON is a special function register (SFR) to set an alarm 1 interrupt time..

Set month data in AL1MON for generation of an alarm.

[Description of Bits]

- **AL1MO4-AL1MO0** (bits 4-0)

The AL1M4 to AL1M0 bits are used to store decimal month data (01 to 12) for generation of an alarm.

Note:

Setting an unrealistic value for month in AL1MON does not generate an alarm 1 interrupt (AL1INT).

When AL1MON is not used as comparison data for generating an alarm, set AL1MON to "00H".

8.3 Description of Operation

RTC stops operation after reset release. As each bit of the date and time registers ((RTCSEC, RTCMIN, RTCHOUR, RTCWEEK, RTCDAY, RTCMON, and RTCYEAR) is undefined, set a date and a time through the software.

Set a date and a time after stopping RTC operation by setting the RTCEN bit of RTCCON to "0".

When starting RTC operation, first reset the low-speed time base counter by writing in the low-speed time base counter register (LTBR) of the low-speed time base counter (LTBC), then set the RTCEN bit to "1" to start RTC operation. By resetting the time base counter, the count in the second register (RTCSEC) can be incremented about one second after the start of RTC operation. See Chapter 7, "Time Base Counter," for the low-speed time base counter.

Table 8-1 lists the count values of each register.

Table 8-1 Count Values of Each Register

Register name		Count value	Remarks
Second register	RTCSEC	00 to 59	
Minute register	RTCMIN	00 to 59	
Hour register	RTCHOUR	00 to 23	24-hour system
Week register	RTCWEEK	01 to 07	
Day register	RTCDAY	01 to 31	Jan., Mar., May, Jul., Aug., Oct., Dec.
		01 to 30	Apr., Jun., Sep., Nov.
		01 to 28	Feb. without leap day
		01 to 29	Feb. with leap day
Month register	RTCMON	01 to 12	
Year register	RTCYEAR	00 to 99	

When reading data of each register of RTC, read data from all the registers twice and check that the values coincide to prevent the reading of undefined data during counting.

Figure 8-2 shows an example of program to read RTC registers.

```

        LEA    offset RTCSEC ; EA←RTCSEC address
MARK:   L      QR0, [EA] ; 1st read
        L      QR8, [EA] ; 2nd read
;
        CMP    ER0, ER8 ; Comparison for RTCSEC and RTCMIN
        CMPCR2, R10 ; Comparison for RTCHOUR
        CMPCR3, R11 ; Comparison for RTCWEEK
        CMPCR4, R12 ; Comparison for RTCDAY
        CMPCR5, R13 ; Comparison for RTCMON
        CMPCR6, R14 ; Comparison for RTCYEAR
        BNE    MARK ; To MARK when the values do not coincide
;
        :

```

Figure 8-2 Example of Program to Read RTC Registers

RTC can generate a periodic interrupt (RTCINT) that occurs at a fixed cycle, an alarm 0 interrupt (AL0INT) that occurs as a result of the coincidence of day-of-the-week/hour/minute data, and an alarm 1 interrupt that occurs as a result of the coincidence of month, day, hour, or minute data.

Options available for periodic interrupts by using the RINT1 and RINT0 bits of RTCCON include periodic interrupt prohibition, 0.5-second interrupt, 1-second interrupt, and 1-minute interrupt.

An alarm 0 interrupt (AL0INT) occurs when carry (RTCSEC: 59 seconds→00 seconds) from the second register (RTCSEC) occurs and the value of the real time clock alarm 0 register (AL0WEEK, AL0HOUR, or AL0MIN) and the value of the day of the week, hour, or minute register (RTCWEEK, RTCHOUR, or RTCMIN) coincide.

An alarm 1 interrupt (AL1INT) occurs when carry (RTCSEC: 59 seconds→00 seconds) from the second register (RTCSEC) occurs and the value of the real time clock alarm 1 register (AL1MON, AL1DAY, AL1HOUR, or AL1MIN) and the value of the month, day, hour, or minute register (RTCMON, RTCDAY, RTCHOUR, or RTCMIN) coincide.

When AL0WEEK, AL1MON, or AL1DAY is not used as comparison data of the alarm, set "00H". For instance, to set the alarm to 8:30 a.m. of each day, set "00H" in AL0WEEK and set data of hour 8 and minute 30 in AL0HOUR and AL0MIN respectively.

Chapter 9

Capture

9. Capture

9.1 Overview

This LSI has two channels of capture circuits that capture the T4KHZ to T32HZ signals of the low-speed base counter (LTBC) to the capture register at the occurrence of P00 and P01 interrupts. The circuits capture timings at which each interrupt occurred, based on the time from the time base counter.

For the external interrupt (P00INT, P01INT) from the P00 or P01 pin, see Chapter 5, "Interrupt" and Chapter 18, "Port 0".

9.1.1 Features

- Time base capture×2ch (4096Hz to 32Hz)

9.1.2 Configuration

Figure 9-1 shows the configuration of the capture circuit.

Figure 9-1 Configuration of Capture Circuit

9.1.3 List of Pins

Pin name	I/O	Description
P00/CAP0	I	Capture 0 input pin Used as the secondary function of the P00 pin.
P01/CAP1	I	Capture 1 input pin Used as the secondary function of the P01 pin.

9.2 Description of Registers

9.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F090H	Capture control register	CAPCON	—	R/W	8	00H
0F091H	Capture status register	CAPSTAT	—	R/W	8	00H
0F092H	Capture data register 0	CAPR0	—	R/W	8	00H
0F093H	Capture data register 1	CAPR1	—	R/W	8	00H

9.2.2 Capture Control Register (CAPCON)

Address: 0F090H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
CAPCON	—	—	—	—	—	—	ECAP1	ECAP0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

CAPCON is a special function register (SFR) to control the capture circuit.

[Description of Bits]

- **ECAP0** (bit 0)

The ECAP0 bit is used to start or stop the operation of capture 0.

ECAP0	Description
0	Stops the capture 0 operation. (initial value)
1	Starts the capture 0 operation.

- **ECAP1** (bit 1)

The ECAP1 bit is used to start or stop the operation of capture 1.

ECAP1	Description
0	Stops the capture 1 operation. (initial value)
1	Starts the capture 1 operation.

9.2.3 Capture Status Register (CAPSTAT)

Address: 0F091H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
CAPSTAT	—	—	—	—	—	—	CAPF1	CAPF0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

CAPSTAT is a special function register (SFR) to indicate a state of the capture circuit.

[Description of Bits]

- **CAPF0** (bit 0)

The CAPF0 bit is the flag to indicate whether data is captured in capture data register 0 (CAPR0) or not.

When the CAPF0 bit is set to "1", it indicates that data is captured in capture data register 0 (CAPR0).

When the CAPF0 bit is set to "1", the next capture operation is stopped. So perform the write operation to capture data register 0 (CAPR0) to clear the CAPF0 bit to "0".

CAPF0	Description
0	No capture 0 latch (initial value)
1	Capture 0 latch

- **CAPF1** (bit 1)

The CAPF1 bit is the flag to indicate whether data is captured in capture data register 0 (CAPR1) or not.

When the CAPF0 bit is set to "1", it indicates that data is captured in capture data register 0 (CAPR1).

When the CAPF1 bit is set to "1", the next capture operation is stopped. So perform the write operation to capture data register 1 (CAPR1) to clear the CAPF0 bit to "0".

CAPF1	Description
0	No capture 1 latch (initial value)
1	Capture 1 latch

9.2.4 Capture Data Register 0 (CAPR0)

Address: 0F092H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
CAPR0	CP07	CP06	CP05	CP04	CP03	CP02	CP01	CP00
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

CAPR0 is a register in which capture data is stored.

The T4KHZ to T32HZ signals of the low-speed time base counter (LTBC) are captured when the P00 interrupt request is generated with the CAPF0 flag (bit 0 of the CAPSTAT register) set to "0".

Writing to CAPR0 sets the CAPF0 flag of CAPSTAT to "0". The value of CAPR0 does not change even if data is written to it.

9.2.5 Capture Data Register 1 (CAPR1)

Address: 0F093H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
CAPR1	CP17	CP16	CP15	CP14	CP13	CP12	CP11	CP10
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

CAPR1 is a register in which capture data is stored.

The T4KHZ to T32HZ signals of the low-speed time base counter (LTBC) are captured when the P01 interrupt request is generated with the CAPF1 flag (bit 1 of the CAPSTAT register) set to "0".

Writing to CAPR1 sets the CAPF1 flag of CAPSTAT to "0". The value of CAPR1 does not change even if data is written to it.

9.3 Description of Operation

The capture circuit starts the capture operation by setting the ECAP0 or ECAP1 bit of the capture control register (CAPCON).

When the input trigger from the P00 or P01 pin selected by the external interrupt control register 0 or 1 (EXICON0 or EXICON1) is generated and the P00 or P01 interrupt request flag (QP00 or QP01) is set to "1", the T4KHZ to T32HZ signals of the low-speed time base counter (LTBC) are captured in the capture register 0 or 1 (CAPR0 or CAPR1) on the next low-speed clock (LSCLK) falling edge and the at the same time, the capture flag (CAPF0 or CAPF1) of the capture status register (CAPSTAT) is set to "1".

When the capture flag (CAPF0, CAPF1) is "1", the following capture operation stops.

After reading the value captured in the capture register 0 or 1 (CAPR0, CAPR1), perform write operation (write data is meaningless) for the capture register 0 or 1 (CAPR0, CAPR1), clear the capture flag (CAPF0, CAPF1) to "0", and wait for the next P00 or P01 interrupt.

Figure 9-2 shows the timing of the capture operation.

Figure 9-2 Timing Diagram of Capture Operation

Note:

When CPU is operating at the high speed (HSCLK), check that the capture flag (CAPF0, CAPF1) is set to "1" after the P00 or P01 interrupt request is generated and then read capture data register 0 or 1 (CAPR0, CAPR1).

1 kHz Timer (1kHzTM)

10. 1 kHz Timer (1kHzTM)

10.1 Overview

This LSI includes a 1 kHz timer to measure 1/1000 seconds.

The 1 kHz timer counts the 1 kHz signal created by dividing the T2KHZ output frequency (2.048 kHz) of the low-speed time base counter (LTBC) and generates a 10 Hz or 1 Hz interrupt (1 kHz timer interrupt).

With the 1 kHz timer, 1/1000 second, which is difficult to generate on a time-base-counter basis, represented by a decimal number can be obtained easily. The timer can be applied to period measurement for stopwatches.

For the timer base counter, see Chapter 7, "Time Base Counter".

10.1.1 Features

- 10 Hz/1 Hz interrupt select function

10.1.2 Configuration

Figure 10-1 shows the configuration of the 1 kHz timer.

Figure 10-1 Configuration of 1 kHz Timer

10.2 Description of Registers

10.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F080H	1 kHz timer count register L	T1KCRL	T1KCR	R/W	8/16	00H
0F081H	1 kHz timer count register H	T1KCRH		R/W	8	00H
0F082H	1 kHz timer control register	T1KCON	—	R/W	8	00H

10.2.2 1 kHz Timer Count Registers (T1KCRL, T1KCRH)

Address: 0F080H

Access: R/W

Access size: 8/16 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
T1KCRL	T1KC3	T1K02	T1KC1	T1KC0	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

Address: 0F081H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
T1KCRH	T1KC11	T1K010	T1KC9	T1KC8	T1KC7	T1K06	T1KC5	T1KC4
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

T1KCRL and T1KCRH are special function registers (SFRs) to read the decimal count values of the 1 kHz timer. When the write operation to T1KCRL or T1KCRH, the valid bit of T1KCRL or T1KCRH is "0" respectively.

[Description of Bits]

- **T1KC11 to T1KC0** (T1KCRH: bits 7 to 0, T1KCRL: bits 7 to 4)
T1KC11 to T1KC0 indicate the count values of the 1 kHz timer.

10.2.3 1 kHz Timer Control Register (T1KCON)

Address: 0F082H
Access: R/W
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
T1KCON	—	—	—	—	—	—	T1KSEL	T1KRUN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

T1KCON is a special function register (SFR) to control the 1 kHz timer.

[Description of Bits]

- **T1KRUN** (bit 0)

The T1KRUN bit is used to control start/stop of the count operation of the 1 kHz timer counter.

T1KRUN	Description
0	Stops 1 kHz timer operation (initial value).
1	Starts 1 kHz operation.

- **T1KSEL** (bit 1)

The T1LSEL bit is used to select the interrupt period of the 1 kHz timer. The 10 Hz or 1 Hz interrupt can be selected.

T1KSEL	Description
0	10 Hz interrupt (initial value)
1	1 Hz interrupt

10.3 Description of Operation

By setting the T1KRUN bit of the 1kHz timer control register (T1KCON) to “1”, the 1kHz timer starts counting of the 1kHz timer counter registers L or H (T1KCRL, T1KCRH).

By dividing the T2KHz signal frequency (2.048kHz) of the low-speed timer base counter (LTBC) by the binary/ternary counter, the timer generates a 1kHz signal. Based on the 1kHz signal, a 1kHz timer interrupt request signal (T1KINT) is generated by the decimal counters of T1KCRL and T1KCRH. The period of the 1kHz timer interrupt can be selected between the 10Hz interrupt or 1Hz interrupt using the T1KSEL bit of T1KCON.

When write operation is performed for T1KCRL or T1KCRH, the value of the binary/ternary counter and the value of T1KCRL or T1KCRH is cleared to “0”.

Data can be read from T1KCRL and T1KCRH. When reading data from T1KCRL or T1KCRH in the 1kHz timer operation start state, read T1KCRL or T1KCRH twice and check that the values match to prevent the reading of undefined data during counting.

Figure 10-2 shows an example of the program for reading T1KCL and T1LCRH.

```
LEA  offset T1KCRL  ; EA←T1KCRL address
MARK:
L   ER0, [EA]       ; First read
L   ER2, [EA]       ; Second read

```

Figure 10-2 Example of Program for Reading T1KCRL and T1KCRH

Chapter 11

Timers

11. Timers

11.1 Overview

This LSI includes 4 channels of 8-bit timers.

For the input clock, see Chapter 6, "Clock Generation Circuit".

11.1.1 Features

- The timer interrupt (TMnINT) is generated when the values of timer counter register (TMnC, n=0 to 3) and timer data register (TMnD) coincide.
- A timer configured by combining timer 0 and timer 1 or timer 2 and timer 3 can be used as a 16-bit timer.
- For the timer clock, the low-speed clock (LSCLK), high-speed time base clock (HTBCLK), or external clock can be selected.

11.1.2 Configuration

Figure 11-1 shows the configuration of the timers.

TMnCON0: Timer control register 0
 TMnCON1: Timer control register 1
 TMmD, TMnD: Timer data registers
 TMmC, TMnC: Timer counter registers

Figure 11-1 Configuration of Timers

11.2 Description of Registers

11.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F030H	Timer 0 data register	TM0D	TM0DC	R/W	8/16	0FFH
0F031H	Timer 0 counter register	TM0C		R/W	8	00H
0F032H	Timer 0 control register 0	TM0CON0	TM0CON	R/W	8/16	00H
0F033H	Timer 0 control register 1	TM0CON1		R/W	8	00H
0F034H	Timer 1 data register	TM1D	TM1DC	R/W	8/16	0FFH
0F035H	Timer 1 counter register	TM1C		R/W	8	00H
0F036H	Timer 1 control register 0	TM1CON0	TM1CON	R/W	8/16	00H
0F037H	Timer 1 control register 1	TM1CON1		R/W	8	00H
0F038H	Timer 2 data register	TM2D	TM2DC	R/W	8/16	0FFH
0F039H	Timer 2 counter register	TM2C		R/W	8	00H
0F03AH	Timer 2 control register 0	TM2CON0	TM2CON	R/W	8/16	00H
0F03BH	Timer 2 control register 1	TM2CON1		R/W	8	00H
0F03CH	Timer 3 data register	TM3D	TM3DC	R/W	8/16	0FFH
0F03DH	Timer 3 counter register	TM3C		R/W	8	00H
0F03EH	Timer 3 control register 0	TM3CON0	TM3CON	R/W	8/16	00H
0F03FH	Timer 3 control register 1	TM3CON1		R/W	8	00H

11.2.2 Timer 0 Data Register (TM0D)

Address: 0F030H
Access: R/W
Access size: 8 bits
Initial value: 0FFH

	7	6	5	4	3	2	1	0
TM0D	T0D7	T0D6	T0D5	T0D4	T0D3	T0D2	T0D1	T0D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	1	1	1	1	1	1	1	1

TM0D is a special function register (SFR) to set the value to be compared with the timer 0 counter register (TM0C) value.

Note:

Set TM0D when the timer stops(When T0STAT bit of TM0CON1 register is “0”).
When “00H” is written in TM0D, TM0D is set to “01H”.

11.2.3 Timer 1 Data Register (TM1D)

Address: 0F034H

Access: R/W

Access size: 8 bits

Initial value: 0FFH

	7	6	5	4	3	2	1	0
TM1D	T1D7	T1D6	T1D5	T1D4	T1D3	T1D2	T1D1	T1D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	1	1	1	1	1	1	1	1

TM1D is a special function register (SFR) to set the value to be compared with the value of the timer 1 counter register (TM1C).

Note:

Set TM1D when the timer stops(When T1STAT bit of TM1CON1 register is “0”).

When “00H” is written in TM1D, TM1D is set to “01H”.

11.2.4 Timer 2 Data Register (TM2D)

Address: 0F038H
Access: R/W
Access size: 8 bits
Initial value: 0FFH

	7	6	5	4	3	2	1	0
TM2D	T2D7	T2D6	T2D5	T2D4	T2D3	T2D2	T2D1	T2D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	1	1	1	1	1	1	1	1

TM2D is a special function register (SFR) to set the value to be compared with the value of the timer 2 counter register (TM2C).

Note:

Set TM2D when the timer stops(When T2STAT bit of TM2CON1 register is “0”).
When “00H” is written in TM2D, TM2D is set to “01H”.

11.2.5 Timer 3 Data Register (TM3D)

Address: 0F03CH

Access: R/W

Access size: 8 bits

Initial value: 0FFH

	7	6	5	4	3	2	1	0
TM3D	T3D7	T3D6	T3D5	T3D4	T3D3	T3D2	T3D1	T3D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	1	1	1	1	1	1	1	1

TM3D is a special function register (SFR) to set the value to be compared with the value of the timer 3 counter register (TM3C).

Note:

Set TM3D when the timer stops(When T3STAT bit of TM3CON1 register is “0”).

When “00H” is written in TM3D, TM3D is set to “01H”.

11.2.6 Timer 0 Counter Register (TM0C)

Address: 0F031H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
TM0C	T0C7	T0C6	T0C5	T0C4	T0C3	T0C2	T0C1	T0C0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

TM0C is a special function register (SFR) that functions as an 8-bit binary counter.

When write operation to TM0C is performed, TM0C is set to "00H". The data that is written is meaningless.

In 16-bit timer mode, if write operation is performed to either the low-order TM0C or high-order TM1C, both the low-order and the high-order are set to "0000H".

During timer operation, the contents of TM0C may not be read depending on the conditions of the timer clock and the system clock.

Table 11-1 shows whether a TM0C read is enabled or disabled during timer operation for each condition of the timer clock and system clock.

Table 11-1 TM0C Read Enable/Disable during Timer Operation

Timer clock T0CK	System clock SYSCLK	TM0C read enable/disable
LSCLK	LSCLK	Read enabled
LSCLK	HSCLK	Read enabled. However, to prevent the reading of undefined data during incremental counting, read consecutively TM0C twice until the last data coincides the previous data.
HTBCLK	LSCLK	Read disabled
HTBCLK	HSCLK	Read enabled
External clock	LSCLK	Read disabled
	HSCLK	

11.2.7 Timer 1 Counter Register (TM1C)

Address: 0F035H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
TM1C	T1C7	T1C6	T1C5	T1C4	T1C3	T1C2	T1C1	T1C0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

TM1C is a special function register (SFR) that functions as an 8-bit binary counter.

When write operation to TM1C is performed, TM1C is set to "00H". The data that is written is meaningless.

In 16-bit timer mode, if write operation is performed to either the low-order TM0C or high-order TM1C, both the low order and the high order are set to "0000H".

When reading TM1C in 16-bit timer mode, be sure to read TM0C first since the count value of TM1C is stored in the TM1C latch when TM0C is read.

During timer operation, the contents of TM1C may not be read depending on the conditions of the timer clock and the system clock.

Table 11-2 shows whether a TM1C read is enabled or disabled during timer operation for each condition of the timer clock and system clock.

Table 11-2 TM1C Read Enable/Disable during Timer Operation

Timer clock T1CK	System clock SYSCLK	TM1C read enable/disable
LSCLK	LSCLK	Read enabled
LSCLK	HSCLK	Read enabled. However, to prevent the reading of undefined data during incremental counting, read consecutively TM1C twice until the last data coincides the previous data
HTBCLK	LSCLK	Read disabled
HTBCLK	HSCLK	Read enabled
External clock	LSCLK	Read disabled
	HSCLK	

11.2.8 Timer 2 Counter Register (TM2C)

Address: 0F039H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
TM2C	T2C7	T2C6	T2C5	T2C4	T2C3	T2C2	T2C1	T2C0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

TM2C is a special function register (SFR) that functions as an 8-bit binary counter.

When write operation to TM2C is performed, TM2C is set to "00H". The data that is written is meaningless.

In 16-bit timer mode, if write operation is performed to either the low-order TM2C or high-order TM3C, both the low order and the high order are set to "0000H".

During timer operation, the contents of TM2C may not be read depending on the conditions of the timer clock and the system clock.

Table 11-3 shows whether a TM2C read is enabled or disabled during timer operation for each condition of the timer clock and system clock.

Table 11-3 TM2C Read Enable/Disable during Timer Operation

Timer clock T2CK	System clock SYSCLK	TM2C read enable/disable
LSCLK	LSCLK	Read enabled
LSCLK	HSCLK	Read enabled. However, to prevent the reading of undefined data during incremental counting, read consecutively TM2C twice until the last data coincides the previous data.
HTBCLK	LSCLK	Read disabled
HTBCLK	HSCLK	Read enabled
External clock	LSCLK	Read disabled
	HSCLK	

11.2.9 Timer 3 Counter Register (TM3C)

Address: 0F03DH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
TM3C	T3C7	T3C6	T3C5	T3C4	T3C3	T3C2	T3C1	T3C0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

TM3C is a special function register (SFR) that functions as an 8-bit binary counter.

When write operation to TM3C is performed, TM3C is set to "00H". The data that is written is meaningless.

In 16-bit timer mode, if write operation is performed to either the low-order (TM2C) or high-order (TM3C), both the low order and the high order are set to "0000H".

When reading TM3C in 16-bit timer mode, be sure to read TM2C first since the count value of TM3C is stored in the TM3C latch when TM2C is read.

During timer operation, the contents of TM3C may not be read depending on the conditions of the timer clock and the system clock.

Table 11-4 shows whether a TM3C read is enabled or disabled during timer operation for each condition of the timer clock and system clock.

Table 11-4 TM3C Read Enable/Disable during Timer Operation

Timer clock T3CK	System clock SYSCLK	TM3C read enable/disable
LSCLK	LSCLK	Read enabled
LSCLK	HSCLK	Read enabled. However, to prevent the reading of undefined data during incremental counting, read consecutively TM3C twice until the last data coincides the previous data.
HTBCLK	LSCLK	Read disabled
HTBCLK	HSCLK	Read enabled
External clock	LSCLK	Read disabled
	HSCLK	

11.2.10 Timer 0 Control Register 0 (TM0CON0)

Address: 0F032H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
TM0CON0	—	—	—	—	—	T01M16	T0CS1	T0CS0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

TM0CON0 is a special function (SFR) to control a timer 0.

Rewrite TM0CON0 while the timer 0 is stopped (T0STAT of the TM0CON1 register is “0”).

[Description of Bits]

- **T0CS1, T0CS0** (bits 1, 0)

The T0CS1 and T0CS0 bits are used for selecting the operation clock of timer 0. LSCLK, HTBCLK, or the external clock (P44/T02P0CK) can be selected by these bits.

T0CS1	T0CS0	Description
0	0	LSCLK (initial value)
0	1	HTBCLK
1	0	Prohibited (timer 0 does not operate)
1	1	External clock (P44/T02P0CK)

- **T01M16** (bit 2)

The T01M16 bit is used for selecting a 8-bit timer mode or a 16-bit timer mode. When the T01M16 bit is set to “1”, timer 0 and timer 1 are connected and they operate as a 16-bit timer.

In 16-bit timer mode, timer 1 is incremented by a timer 0 overflow signal. A timer 0 interrupt (TM0INT) is not generated.

T01M16	Description
0	8-bit timer mode (initial value)
1	16-bit timer mode

11.2.11 Timer 1 Control Register 0 (TM1CON0)

Address: 0F036H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
TM1CON0	—	—	—	—	—	—	T1CS1	T1CS0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

TM1CON0 is a special function (SFR) to control a timer 1.

Rewrite TM1CON0 while the timer 1 is stopped (T1STAT of the TM1CON1 register is “0”).

[Description of Bits]

- **T1CS1, T1CS0** (bits 1, 0)

The T1CS1 and T1CS0 bits are used for selecting the operation clock of timer 1. LSCLK, HTBCLK, or the external clock (P45/T13P0CK) can be selected by these bits.

In cases where the 16-bit timer mode has been selected by setting T01M16 of TM0CON to “1”, the values of T1CS1 and T1CS0 are invalid.

T1CS1	T1CS0	Description
0	0	LSCLK (initial value)
0	1	HTBCLK
1	0	Prohibited (timer 1 does not operate)
1	1	External clock (P45/T13P1CK)

11.2.12 Timer 2 Control Register 0 (TM2CON0)

Address: 0F03AH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
TM2CON0	—	—	—	—	—	T23M16	T2CS1	T2CS0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

TM2CON0 is a special function (SFR) to control a timer 2.

Rewrite TM2CON0 while the timer 2 is stopped (T2STAT of the TM2CON1 register is “0”).

[Description of Bits]

- **T2CS1, T2CS0** (bits 1, 0)

The T2CS1 and T2CS0 bits are used for selecting the operation clock of timer 2. LSCLK, HTBCLK, or the external clock (P44/T02P0CK) can be selected by these bits.

T2CS1	T2CS0	Description
0	0	LSCLK (initial value)
0	1	HTBCLK
1	0	Prohibited (timer 2 does not operate)
1	1	External clock (P44/T02P0CK)

- **T23M16** (bit 2)

The T23M16 bit is used for selecting a 8-bit timer mode or a 16-bit timer mode. When T23M16 is set to “1”, timer 2 and timer 3 are connected and they operate as a 16-bit timer.

In 16-bit timer mode, timer 3 is incremented by a timer 2 overflow signal. A timer 2 interrupt (TM2INT) is not generated.

T23M16	Description
0	8-bit timer mode (initial value)
1	16-bit timer mode

11.2.13 Timer 3 Control Register 0 (TM3CON0)

Address: 0F03EH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
TM3CON0	—	—	—	—	—	—	T3CS1	T3CS0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

TM3CON0 is a special function (SFR) to control a timer 3.

Rewrite TM3CON0 while the timer 3 is stopped (T3STAT of the TM3CON1 register is “0”).

[Description of Bits]

- **T3CS1, T3CS0** (bits 1, 0)

The T3CS1 and T3CS0 bits are used for selecting the operation clock of timer 3. LSCLK, HTBCLK, or the external clock (P44/T13P1CK) can be selected by these bits.

In cases where the 16-bit timer mode has been selected by setting T23M16 of TM2CON to “1”, the values of T3CS1 and T3CS0 are invalid.

T3CS1	T3CS0	Description
0	0	LSCLK (initial value)
0	1	HTBCLK
1	0	Prohibited (timer 3 does not operate)
1	1	External clock (P45/T13P1CK)

11.2.14 Timer 0 Control Register 1 (TM0CON1)

Address: 0F033

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
TM0CON1	T0STAT	—	—	—	—	—	—	T0RUN
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

TM0CON1 is a special function register (SFR) to control a timer 0.

[Description of Bits]

- **T0RUN** (bit 0)

The T0RUN bit is used for controlling count stop/start of timer 0.

T0RUN	Description
0	Stops counting.
1	Starts counting.

- **T0STAT** (bit 7)

The T0STAT bit is used for indicating “counting stopped”/”counting in progress” of timer 0.

T0STAT	Description
0	Counting stopped.
1	Counting in progress.

11.2.15 Timer 1 Control Register 1 (TM1CON1)

Address: 0F037H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
TM1CON1	T1STAT	—	—	—	—	—	—	T1RUN
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

TM1CON1 is a special function register (SFR) to control a timer 1.

[Description of Bits]

- **T1RUN** (bit 0)

The T1RUN bit is used for controlling count stop/start of timer 1.

In 16-bit timer mode, be sure to set this bit to “0”. Timer 1 is incremented caused by a timer 0 overflow signal regardless of the value of T1RUN.

T1RUN	Description
0	Stops counting.
1	Starts counting.

- **T1STAT** (bit 7)

The T1STAT bit is used for indicating “counting stopped”/”counting in progress” of timer 1.

In 16-bit timer mode, this bit will read “0”.

T1STAT	Description
0	Counting stopped.
1	Counting in progress.

11.2.16 Timer 2 Control Register 1 (TM2CON1)

Address: 0F03BH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
TM2CON1	T2STAT	—	—	—	—	—	—	T2RUN
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

TM2CON1 is a special function register (SFR) to control a timer 2.

[Description of Bits]

- **T2RUN** (bit 0)

The T2RUN bit is used for controlling count stop/start of timer 2.

T2RUN	Description
0	Stops counting.
1	Starts counting.

- **T2STAT** (bit 7)

The T2STAT bit is used for indicating “counting stopped”/”counting in progress” of timer 2.

T2STAT	Description
0	Counting stopped.
1	Counting in progress.

11.2.17 Timer 3 Control Register 1 (TM3CON1)

Address: 0F03FH
Access: R/W
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
TM3CON1	T3STAT	—	—	—	—	—	—	T3RUN
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

TM3CON1 is a special function register (SFR) to control a timer 3.

[Description of Bits]

- **T3RUN** (bit 0)

The T3RUN bit is used for controlling count stop/start of timer 3.

In 16-bit timer mode, be sure to set this bit to “0”. Timer 3 is incremented caused by a timer 2 overflow signal regardless of the value of T3RUN.

T3RUN	Description
0	Stops counting.
1	Starts counting.

- **T3STAT** (bit 7)

The T3STAT bit is used for indicating “counting stopped”/”counting in progress” of timer 3.

In 16-bit timer mode, this bit will read “0”.

T3STAT	Description
0	Counting stopped.
1	Counting in progress.

11.3 Description of Operation

The timer counters (TMnC) are set to an operating state (TnSTAT are set to "1") on the first falling edge of the timer clocks (TnCK) that are selected by the Timer 0 to 3 control register 0 (TMnCON0) when the TnRUN bits of timer 0 to 3 control register 1 (TMnCON1) are set to "1" and increment the count value on the 2nd falling.

When the count value of TM0 to TM3C and the timer 0 to 3 data register (TMnD) coincide, timer 0 to 3 interrupt (TMnINT) occurs on the next timer clock falling edge, TMnC are reset to "00H" and incremental counting continues.

When the TnRUN bits are set to "0", TMnC stop counting after counting once the falling of the timer clock (TnCK). Confirm that TMnC has been stopped by checking that the TnSTAT bit of the Timer 0–3 control register 1 (TMnCON1) is "0". When the TnRUN bits are set to "1" again, TMn restart incremental counting from the previous values. To initialize TMnC to "00H", perform write operation in TMnC.

The timer interrupt period (TTMI) is expressed by the following equation.

$$TTMI = \frac{TMnD + 1}{TnCK \text{ (Hz)}} \quad (n = 0 \text{ to } 3)$$

TMnD: Timer 0 to 3 data register (TMnD) setting value (01H to 0FFH)

TnCK: Clock frequency selected by the Timer 0 to 3 control register 0 (TMnCON0)

After the TnRUN bits are set to "1", timers are synchronized by the timer clock and counting starts so that an error of a maximum of 1 clock period occurs until the first timer interrupt. The timer interrupt periods from the second time are constant.

Figure 11-2 shows the operation timing diagram of Timer 0 to 3.

Figure 11-2 Operation Timing Diagram of Timer 0 to 3

Note:

Even if "0" is written to the TnRUN bits, counting operation continues up to the falling edge (the timer 0 to 3 status flag (TnSTA) is in a "1" state) of the next timer clock pulse. Therefore, the timer 0 to 3 interrupt (TMnINT) may occur.

Chapter 12

PWM

12. PWM

12.1 Overview

This LSI includes one channel of 16-bit PWM (Pulse Width Modulation).

The PWM output (PWM0) function is assigned to P43(Port 4) and P34(Port 3) as the tertiary function. For the functions of port 4 and port3, see Chapter 22, "Port 4" and Chapter 21, "Port 3".

12.1.1 Features

- The PWM signals with the periods of approximately 488 ns (HTBCLK=4.096MHz) to 2s (@LSCLK=32.768kHz) can be generated and output outside of the LSI.
- The output logic of the PWM signal can be switched to the positive or negative logic.
- At the coincidence of PWM signal period, duties, and period & duty, a PWM interrupt (PW0INT) occurs.
- For the PWM clock, a low-speed clock (LSCLK), a high-speed time base clock (HTBCLK), and an external clock are available.

12.1.2 Configuration

Figure 12 - 1 shows the configuration of the PWM circuit.

PW0PL:	PWM0 period register L
PW0PH:	PWM0 period register H
PW0PBUF:	PWM0 period buffer
PW0DL:	PWM0 duty register L
PW0DH:	PWM0 duty register H
PW0DBUF:	PWM0 duty buffer
PW0CL:	PWM0 counter register L
PW0CH:	PWM0 counter register H
PW0CON0:	PWM0 control register 0
PW0CON1:	PWM0 control register 1

Figure 12-1 Configuration of PWM Circuit

12.1.3 List of Pins

Pin name	I/O	Description
P43/PWM0	O	PWM0 output pin Used for the secondary function of the P43 pin.
P34/PWM0	O	PWM0 output pin Used for the secondary function of the P34 pin.

12.2 Description of Registers

12.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F0A0H	PWM0 period register L	PW0PL	PW0P	R/W	8/16	0FFH
0F0A1H	PWM0 period register H	PW0PH		R/W	8	0FFH
0F0A2H	PWM0 duty register L	PW0DL	PW0D	R/W	8/16	00H
0F0A3H	PWM0 duty register H	PW0DH		R/W	8	00H
0F0A4H	PWM0 counter register L	PW0CL	PW0C	R/W	8/16	00H
0F0A5H	PWM0 counter register H	PW0CH		R/W	8	00H
0F0A6H	PWM0 control register 0	PW0CON0	PW0CON	R/W	8/16	00H
0F0A7H	PWM0 control register 1	PW0CON1		R/W	8	40H

12.2.2 PWM0 Period Registers (PW0PL, PW0PH)

Address: 0F0A0H

Access: R/W

Access size: 8 bits

Initial value: 0FFH

	7	6	5	4	3	2	1	0
PW0PL	P0P7	P0P6	P0P5	P0P4	P0P3	P0P2	P0P1	P0P0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
At reset	1	1	1	1	1	1	1	1

Address: 0F0A1H

Access: R/W

Access size: 8 bits

Initial value: 0FFH

	7	6	5	4	3	2	1	0
PW0PH	P0P15	P0P14	P0P13	P0P12	P0P11	P0P10	P0P9	P0P8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
At reset	1	1	1	1	1	1	1	1

PW0PH and PW0PL are special function registers (SFRs) to set the PWM0 periods.

Note:

When PW0PH or PW0PL is set to “0000H”, the PWM0 period buffer (PW0PBUF) is set to “0001H”.

12.2.3 PWM0 Duty Registers (PW0DL, PW0DH)

	7	6	5	4	3	2	1	0
PW0DL	P0D7	P0D6	P0D5	P0D4	P0D3	P0D2	P0D1	P0D0

At reset	0	0	0	0	0	0	0	0

Address: 0F0A3H

Access: R/W

Access size: 8 bits

Initial value: 00H

PW0DH and PW0DL are special function registers (SFRs) to set the duties of PWM0.

Note:

Set PW0DH and PW0DL to values smaller than those to which PW0PH and PW0PL are set.

12.2.4 PWM0 Counter Registers (PW0CH, PW0CL)

	7	6	5	4	3	2	1	0
PW0CL	P0C7	P0C6	P0C5	P0C4	P0C3	P0C2	P0C1	P0C0

At reset	0	0	0	0	0	0	0	0

Address: 0F0A4H
Access: R/W
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
PW0DH	P0C15	P0C14	P0C13	P0C12	P0C11	P0C10	P0C9	P0C8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
At reset	0	0	0	0	0	0	0	0

Address: 0F0A5H
Access: R/W
Access size: 8 bits
Initial value: 00H

PW0CL and PW0CH are special function registers (SFRs) that function as 16-bit binary counters. When data is written to either PW0CL or PW0CH, PW0CL and PW0CH is set to "0000H". The data that is written is meaningless. When data is read from PW0CL, the value of PW0CH is latched. When reading PW0CH and PW0CL, use a word type instruction or pre-read PW0CL.

The contents of PW0CH and PW0CL during PWM operation cannot be read depending on the combination of the PWM clock and system clock. Table 12-1 shows PW0CH and PW0CL read enable/disable for each combination of the PWM clock and system clock.

Table 12-1 PW0CH and PW0CL Read Enable/Disable during PWM0 Operation

PWM clock P0CK	System clock SYSCLK	PW0CH and PW0CL read enable/disable
LSCLK	LSCLK	Read enabled
LSCLK	HCLK	Read enabled. However, to prevent the reading of undefined data during counting, read consecutively PW0CH or PW0CL twice until the last data coincides the previous data.
HTBCLK	LSCLK	Read disabled
HTBCLK	HCLK	Read enabled
External clock	LSCLK	Read disabled
	HCLK	

12.2.5 PWM0 Control Register 0 (PW0CON0)

	7	6	5	4	3	2	1	0
PW0CON0	—	—	—	P0NEG	P0IS1	P0IS0	P0CS1	P0CS0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
At reset	0	0	0	0	0	0	0	0

Address: 0F0A6H

Access: R/W

Access size: 8 bits

Initial value: 00H

PW0CON0 is a special function register (SFR) to control PWM.

[Description of Bits]

- **P0CS1, P0CS0** (bits 1, 0)

The P0CS1 and P0CS0 bits are used to select the PWM0 operation clocks. LSCLK, HTBCLK, or the external clock (P44/T02P0CK) can be selected.

P0CS1	P0CS0	Description
0	0	LSCLK (initial value)
0	1	HTBCLK
1	0	Prohibited (the PWM circuit does not operate)
1	1	External clock (P44/T02P0CK)

- **P0IS1, P0IS0** (bits 3, 2)

The P0IS1 and P0IS0 bits are used to select the point at which the PWM0 interrupt occurs. “When the periods coincide”, “when the duties coincide”, or “when the periods and duties coincide” can be selected.

P0IS1	P0IS0	Description
0	0	When the periods coincide. (Initial value)
0	1	When the duties coincide.
1	*	When the periods and duties coincide.

- **P0NEG** (bit 4)

The P0NEG bit is used to select the output logic. When the positive logic is selected, the initial value of PWM0 output is “1”, and when the negative logic is selected, the initial value of PWM0 output is “0”.

P0NEG	Description
0	Positive logic (initial value)
1	Negative logic

12.2.6 PWM0 Control Register 1 (PW0CON1)

	7	6	5	4	3	2	1	0
PW0CON1	P0STAT	P0FLG	—	—	—	—	—	P0RUN
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
At reset	0	1	0	0	0	0	0	0

Address: 0F0A7H

Access: R/W

Access size: 8 bits

Initial value: 40H

PW0CON1 is a special function register (SFR) to control PWM0.

[Description of Bits]

- **P0RUN** (bit 0)

The P0RUN bit is used to control count stop/start of PWM0.

P0RUN	Description
0	Stops counting. (Initial value)
1	Starts counting.

- **P0FLG** (bit 6)

The P0FLG bit is used to read the output flag of PWM0.

This bit is set to “1” when write operation to PW0CH or PW0CL is performed,

P0FLG	Description
0	PWM0 output flag = “0”
1	PWM0 output flag = “1” (initial value)

- **P0STAT** (bit 7)

The P0STAT bit indicates “counting stopped or “counting in progress” of PWM0.

P0STAT	Description
0	Counting stopped. (Initial value)
1	Counting in progress.

12.3 Description of Operation

The PWM0 counter registers (PW0CH, PW0CL) are set to an operating state (P0STAT is set to "1") on the first falling edge of the PWM clock (P0CK) that are selected by the PWM0 control register 0 (PW0CON0) when the P0RUN bit of PWM0 control register 1 (PW0CON1) is set to "1" and increment the count value on the 2nd falling edge.

When the count value of PWM0 counter registers and the value of the PWM0 duty buffer (PW0DBUF) coincide, the PWM flag (P0FLG) is set to "0" on the next timer clock falling edge of P0CK.

When the count value of PWM0 counter registers and the value of the PWM0 period buffer (PW0PBUF) coincide, the PWM flag (P0FLG) is set to "1" on the next falling edge of P0CK and PWM0 counter registers is set to "0000H" and incremental counting continues. At the same time, the value of the PWM0 duty register (PW0DH, PW0DL) is transferred to the PWM0 duty buffer (PW0DBUF) and the value of PWM0 period register (PW0PH, PW0PL) to the PWM0 period buffer (PW0PBUF).

When the P0RUN bit is set to "0", PWM0 counter registers stop counting after counting once the falling of the PWM clock (P0CK). Confirm that PW0CH and PW0CL are stopped by checking that the PnSTAT bit of the PWM0 control register 1 (PW0CON1) is "0". When the P0RUN bit is set to "1" again, PWM0 counter registers restarts incremental counting from the previous value on the falling edge of P0CK.

To initialize PWM0 counter registers to "0000H", perform write operation in either of PW0CH or PW0CL. At that time, P0FLG is also set to "1". When data is written in the PWM0 duty register (PW0DH, PW0DL) during count stop (P0RUN is in a "1" state), the data is transferred to the PWM0 duty buffer (PW0DBUF) and when data is written in the PWM0 period register (PW0PH, PW0PL), the data is transferred to the PWM0 period buffer (PW0PBUF).

The PWM clock, the point at which an interrupt of PWM0 occurs, and the logic of the PWM output are selected by PWM0 control register 0 (PW0CN0).

The period of the PWM0 signal (TPWP) and the first half duration (TPWD) of the duty are expressed by the following equations.

$$T_{PWP} = \frac{PW0P + 1}{P0CK \text{ (Hz)}}$$

$$T_{PWP} = \frac{PW0D + 1}{P0CK \text{ (Hz)}}$$

PW0P: PWM0 period registers (PW0PH, PW0PL) setting value (0001H to 0FFFFH)
PW0D: PWM0 duty registers (PW0DH, PW0DL) setting value (0000H to 0FFFEH)
P0CK: Clock frequency selected by the PWM0 control register 0 (PW0CON0)

After the P0RUN bit is set to “1”, counting starts in synchronization with the PWM clock. This causes an error of up to 1 clock pulse to the time the first PWM interrupt is issued. The PWM interrupt period from the second time is fixed.

Figure 12-2 shows the operation timing of PWM0.

Figure 12-2 (1/2) Operation Timing Diagram of PWM0

Figure 12-2 (2/2) Operation Timing Diagram of PWM0

Note:

Even if “0” is written to the P0RUN bit, counting operation continues up to the falling edge (the PWM0 status flag (P0STAT) is in a “1” state) of the next PWM clock pulse. Therefore, the PWM0 interrupt (PW0INT) may occur.

12.4 Specifying port registers

When you want to make sure the PWM function is working, please check related port registers are specified. See Chapter 22, "Port 4" and Chapter 21, "Port 3" for detail about the port registers.

12.4.1 Functioning P43 (PWM0) as the PWM output

Set P43MD1 bit (bit3 of P4MOD1 register) to "1" and set P43MD0 bit (bit3 of P4MOD0 register) to "0", for specifying the PWM output as the tertiary function of P43.

Reg. name	P4MOD1 register (Address: 0F225H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47MD1	P46MD1	P45MD1	P44MD1	P43MD1	P42MD1	P41MD1	P40MD1
Data	*	*	*	*	1	*	*	*

Reg. name	P4MOD0 register (Address: 0F224H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47MD0	P46MD0	P45MD0	P44MD0	P43MD0	P42MD0	P41MD0	P40MD0
Data	*	*	*	*	0	*	*	*

Set P43C1 bit (bit3 of P4CON1 register) to "1", set P43C0 bit (bit3 of P4CON0 register) to "1" and set P43DIR bit (bit3 of P4DIR register) to "0", for specifying the P43 as CMOS output.

Reg. name	P4CON1 register (Address: 0F223H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47C1	P46C1	P45C1	P44C1	P43C1	P42C1	P41C1	P40C1
Data	*	*	*	*	1	*	*	*

Reg. name	P4CON0 register (Address: 0F222H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47C0	P46C0	P45C0	P44C0	P43C0	P42C0	P41C0	P40C0
Data	*	*	*	*	1	*	*	*

Reg. name	P4DIR register (Address: 0F221H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47DIR	P46DIR	P45DIR	P44DIR	P43DIR	P42DIR	P41DIR	P40DIR
Data	*	*	*	*	0	*	*	*

Data of P43D bit (bit3 of P4D register) does not affect to the PWM output function, so don't care the data for the function.

Reg. name	P4D register (Address: 0F220H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47D	P46D	P45D	P44D	P43D	P42D	P41D	P40D
Data	*	*	*	*	**	*	*	*

* : Bit not related to the PWM function

** : Don't care the data.

12.4.2 Functioning P34 (PWM0) as the PWM output

Set P34MD1 bit (bit4 of P3MOD1 register) to “1” and set P34MD0 bit (bit4 of P3MOD0 register) to “0”, for specifying the PWM output as the tertiary function of P34.

Reg. name	P3MOD1 register (Address: 0F21DH)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	P35MD1	P34MD1	P33MD1	P32MD1	P31MD1	P30MD1
Data	-	-	*	1	*	*	*	*

Reg. name	P3MOD0 register (Address: 0F21CH)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	P35MD0	P34MD0	P33MD0	P32MD0	P31MD0	P30MD0
Data	-	-	*	0	*	*	*	*

Set P34C1 bit (bit4 of P3CON1 register) to “1”, set P34C0 bit(bit4 of P3CON0 register) to “1” and set P34DIR bit(bit4 of P3DIR register) to “0”, for specifying the P34 as CMOS output.

Reg. name	P3CON1 register (Address: 0F21BH)							
Bit	7	6	5	4	3	2	1	0

** : Don't care the data.

Chapter 13

Watchdog Timer

13. Watchdog Timer

13.1 Overview

This LSI incorporates a watchdog timer (WDT) that operates at a system reset unconditionally (free-run operation) in order to detect an undefined state of the MCU and return from that state.

If the WDT counter overflows due to the failure of clearing of the WDT counter within the WDT overflow period, the watchdog timer requests a WDT interrupt (non-maskable interrupt). When the second overflow occurs, the watchdog timer generates a WDT reset signal and shifts the mode to a system reset mode.

For interrupts see Chapter 5, "Interrupts," and for WDT interrupt see Chapter 3, "Reset Function".

13.1.1 Features

- Free running (cannot be stopped)
- One of four types of overflow periods (125ms, 500ms, 2s, and 8s) selectable by software
- Non-maskable interrupt by the first overflow
- Reset generated by the second overflow

13.1.2 Configuration

Figure 13-1 shows the configuration of the watchdog timer.

Figure 13-1 Configuration of Watchdog Timer

13.2 Description of Registers

13.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F00EH	Watchdog timer control register	WDTCON	—	R/W	8	00H
0F00FH	Watchdog timer mode register	WDTMOD	—	R/W	8	02H

13.2.2 Watchdog Timer Control Register (WDTCON)

Address: 0F00EH

Access: W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
WDTCON	d7	d6	d5	d4	d3	d2	d1	WDP/d0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

WDTCON is a special function register (SFR) to clear the WDT counter.

When WDTCON is read, the value of the internal pointer (WDP) is read from bit 0.

[Description of Bits]

- **WDP/d0** (bit 0)

The value of the internal pointer (WDP) is read from this bit. The WDP is reset to "0" at the system reset or Watch Dog Timer overflow and is inverted every writing to WDTCON.

- **d7-d0** (bits 7-0)

This bit is used to write data to clear the WDT counter. Write "5AH" on the condition of WDP is "0" and write "0A5H" on the condition of WDP is "1".

Note:

When the WDT interrupt (WDTINT) occurs by the first WDT counter overflow, the counter and the internal pointer (WDP) are initialized for a half cycle of low speed clock (about 15us). During the time period that they are initialized, writing to WDTCON is disabled and the logic of WDP does not change. Therefore, in the case of that you have program codes handle to clear the WDT when the first overflow WDT interrupt occurs and also the codes run at high-speed system clock, please check the WDP gets reversed after writing to WDTCON to see if the writing was surely successful. For example of the program code, see Section 13.3.1, "Handling example when you do not want to use the watch dog timer".

13.2.3 Watchdog Timer Mode Register (WDTMOD)

Address: 0F00FH

Access: W

Access size: 8 bits

Initial value: 02H

	7	6	5	4	3	2	1	0
WDTMOD	—	—	—	—	—	—	WDT1	WDT0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	1	0

WDTMOD is a special function register to set the overflow period of the watchdog timer.

[Description of Bits]

- **WDT1-0** (bits 1-0)

These bits are used to select an overflow period of the watchdog timer.

The WDT1 and WDT0 bits set a overflow period (TWOV) of the WDT counter. One of 125ms, 500ms, 2s, and 8s can be selected.

WDT1	WDT0	Description
0	0	125 ms
0	1	500 ms
1	0	2 s (initial value)
1	1	8 s

13.3 Description of Operation

The WDT counter starts counting after the system reset has been released and the low-speed clock oscillation start.. Write "5AH" when the internal pointer (WDP) is "0" and then the WDT counter is cleared by writing "0A5H" when WDP is "1".

WDP is reset to "0" at the time of system reset or when the WDT counter overflows and is inverted whenever data is written to WDTCON.

When the WDT counter cannot be cleared within the WDT counter overflow period (T_{WOV}), a watchdog timer interrupt (WDTINT) occurs. If the WDT counter is not cleared even by the software processing performed following the watchdog timer interrupt and overflow occurs again, WDT reset occurs and the mode shifts to a system reset mode.

For the overflow period (TWOV) of the WDT counter, one of 125ms, 500ms, 2s, and 8s can be selected by the watchdog mode register (WDTMOD).

Clear the WDT counter within the clear period of the WDT counter shown in Table 13-1.

Table 13-1 Clear Period of WDT Counter

WDT1	WDT0	T_{WOV}	T_{WCL}
0	0	125 ms	Approx. 121 ms
0	1	500 ms	Approx. 496 ms
1	0	2000 ms	Approx. 1996 ms
1	1	8000 ms	Approx. 7996 ms

Figure 13-2 shows an example of watchdog timer operation.

Figure 13-2 Example of Watchdog Timer Operation

- ① The WDT counter starts counting after the system reset has been released and the low-speed clock oscillation start.
- ② The overflow period of the WDT counter (T_{WOV}) is set to WDTMOD.
- ③ “5AH” is written to WDTCON. (Internal pointer 0→1)
- ④ “0A5H” is written to WDTCON and the WDT counter is cleared. (Internal pointer 1→0)
- ⑤ “5AH” is written to WDTCON. (Internal pointer 0→1)
- ⑥ When “5AH” is written to WDTCON after the occurrence of abnormality, it cannot be accepted as the internal pointer is set to “1”. (Internal pointer 1→0)
- ⑦ Although “0A5H” is written to WDTCON, the WDT counter is not cleared since the internal pointer is “0” and the writing of “5AH” is not accepted in ⑥. (Internal pointer 0→1)
- ⑧ The WDT counter overflows and a watchdog timer interrupt request (WDTINT) is generated. In this case, the WDT counter and the internal pointer (WDP) are initialized for a half cycle of low speed clock (about 15.26μs). (Internal pointer 1→0)
- ⑨ If the WDT counter is not cleared even by the software processing performed following a watchdog timer interrupt and the WDT counter overflows again, WDT reset occurs and the mode is shifted to a system reset mode.

Note:

- In STOP mode, the watchdog timer operation also stops.
- In HALT mode, the watchdog timer operation does not stop. When the WDT interrupt occurs, the HALT mode is released.
- The watchdog timer cannot detect all the abnormal operations. Even if the CPU loses control, the watchdog timer cannot detect the abnormality in the operation state in which the WDT counter is cleared.

13.3.1 Handling example when you do not want to use the watchdog timer

WDT counter is a free-run counter that starts count-up automatically after the system reset released and the low-speed clock (LSCLK) starts oscillating. If the WDT counter gets overflow, the WDT non-maskable interrupt occurs and then a system reset occurs. Therefore, it is needed to clear the WDT counter even if you do not want to use the WDT as a fail-safe function.

See following example programming codes to clear the WDT counter in the interrupt routine.

Example programming code:

```
__DI();                // Disable multi-interrupts
do
{
    WDTCON = 0x5a;
} while(WDP != 1)
WDTCON = 0xa5;
__EI();
```

Synchronous Serial Port

14. Synchronous Serial Port

14.1 Overview

This LSI includes one channel of the 8/16-bit synchronous serial port (SSIO) and can also be used to control the device incorporated with the SPI interface by using one GPIO as the chip enable pin.

For the input clock, see Chapter 6, "Clock Generation Circuit".

When the synchronous serial port is used, the tertiary functions of port 4 must be set. For the tertiary functions of port 4, see Chapter 22, "Port 4".

14.1.1 Features

- Master or slave selectable
- MSB first or LSB first selectable
- 8-bit length or 16-bit length selectable fro the data length

14.1.2 Configuration

Figure 14-1 shows the configuration of the synchronous serial port.

Figure 14-1 Configuration of Synchronous Serial Port

14.1.3 List of Pins

Pin name	I/O	Description
P40/SIN0 P44/SIN0	I	Receive data input. Used for the tertiary function of the P40 and P44 pins.
P41/SCK0 P45/SCK0	I/O	Synchronous clock input/output. Used for the tertiary function of the P41 and P45 pins.
P42/SOUT0 P46/SOUT0	O	Transmit data output. Used for the tertiary function of the P42 and P46 pins.

14.2 Description of Registers

14.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F280H	Serial port 0 transmit/receive buffer L	SIO0BUFL	SIO0BUF	R/W	8/16	00H
0F281H	Serial port 0 transmit/receive buffer H	SIO0BUFH		R/W	8	00H
0F282H	Serial port 0 control register	SIO0CON	—	R/W	8	00H
0F284H	Serial port 0 mode register 0	SIO0MOD0	SIO0MOD	R/W	8/16	00H
0F285H	Serial port 0 mode register 1	SIO0MOD1		R/W	8	00H

14.2.2 Serial Port Transmit/Receive Buffers (SIO0BUFL, SIO0BUFH)

Address: 0F280H

Access: R/W

Access size: 8 bits/16 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
SIO0BUFL	S0B7	S0B6	S0B5	S0B4	S0B3	S0B2	S0B1	S0B0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

Address: 0F281H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
SIO0BUFH	S0B15	S0B14	S0B13	S0B12	S0B11	S0B10	S0B9	S0B8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

SIO0BUFL and SIO0BUFH are special function registers (SFRs) to write transmit data and to read receive data of the synchronous serial port.

When data is written in SIO0BUFL and SIO0BUFH, the data is written in the transmit registers (SIO0TRL and SIO0TRH) and when data is read from SIO0BUFL and SIO0BUFH, the contents of the receive registers (SIO0RCL and SIO0RCH) are read.

14.2.3 Serial Port Control Register (SIO0CON)

Address: 0F282H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
SIO0CON	—	—	—	—	—	—	—	S0EN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

SIO0CON is a special function register (SFR) to control the synchronous serial port.

[Description of Bits]

- **S0EN** (bit 0)

The S0EN bit is used to specify start of synchronous serial communication. Writing a “1” to this bit starts 8-/16-bit data communication. This bit is set to “0” automatically when 8-/16-bit data communication is terminated.

The S0EN bit is set to “0” at a system reset.

S0EN	Description
0	Stops communication. (Initial value)
1	Starts communication

14.2.4 Serial Port Mode Register 0 (SIO0MOD0)

Address: 0F284H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
SIO0MOD0	—	—	—	—	S0LG	S0MD1	S0MD0	S0DIR
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

SIO0MOD0 is a special function register (SFR) to set mode of the synchronous serial port.

[Description of Bits]

- **S0DIR** (bit 0)

The S0DIR is used to select LSB first or MSB first.

S0DIR	Description
0	LSB first (initial value)
1	MSB first

- **S0MD1, S0MD0** (bits 2, 1)

The S0MD1 and S0MD0 bits are used to select transmit, receive, or transmit/receive mode of the synchronous serial port.

S0MD1	S0MD0	Description
0	0	Stops transmission/reception (initial value)
0	1	Receive mode
1	0	Transmit mode
1	1	Transmit/receive mode

- **S0LG** (bit 3)

The S0LG bit is used to specify the bit length of the transmit/receive buffer, 8-bit or 16-bit length. The S0LG bit is set to "0" at a system reset.

S0LG	Description
0	8-bit length (initial value)
1	16-bit length

Note:

- Do not change any of the SIO0MOD0 register settings during transmission/reception.
- When the synchronous serial port is used, the tertiary functions of GPIO must be set. For the tertiary functions of Port 4, see Chapter 22, "Port 4".

14.2.5 Serial Port Mode Register 1 (SIO0MOD1)

Address: 0F285H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
SIO0MOD1	—	—	—	S0CKT	—	S0CK2	S0CK1	S0CK0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

SIO0MOD1 is a special function register (SFR) to set mode of the synchronous serial port.

[Description of Bits]

- **S0CK2 to S0CK0** (bits 2 to 0)

The S0CK2 to S0CK0 bits are used to select the transfer clock of the synchronous serial port. When the internal clock is selected, this LSI is set to master mode and when the external clock is selected, it is set to slave mode.

S0CK2	S0CK1	S0CK0	Description
0	0	0	32 KHz (initial value)
0	0	1	16 KHz
0	1	0	1/4 HSCLK
0	1	1	1/8 HSCLK
1	0	0	1/16 HSCLK
1	0	1	1/32 HSCLK
1	1	0	External clock 0 (P41/SCK0)
1	1	1	External clock 1 (P45/SCK0)

- **S0CKT** (bit 4)

The S0CKT bit is used to select a transfer clock output phase.

S0CKT	Description
0	Clock type 0: Clock is output with a "H" level being the default. (Initial value)
1	Clock type 1: Clock is output with a "L" level being the default.

14.3 Description of Operation

14.3.1 Transmit Operation

When “1” is written to the S0MD1 bit and “0” is written to the S0MD0 bit of the serial mode register (SIO0MOD0), this LSI is set to a transmit mode.

When transmit data is written to the serial port transmit /receive buffer (SIO0BUFL and H) and the S0EN bit of the serial port control register (SIO0CON) is set to “1”, transmission starts. When transmission of 8/16-bit data terminates, a synchronous serial port interrupt (SIO0INT) occurs and the S0EN bit is set to “0”.

Transmit data is output from the tertiary function pins (P42/SOUT0 or P46/SOUT0) of GPIO.

When an internal clock is selected in the serial port mode register (SIO0MOD1), the LSI is set to a master mode and when an external clock (P41/SCK0 or P45/SCK0) is selected, the LSI is set to a slave mode.

The serial port mode register (SIO0MOD0) enables selection of MSB first/LSB first.

The transmit data output pin (P42/SOUT0 or P46/SOUT0) and transfer clock input/output pin (P41/SCK0 or P45/SCK0) must be set to the tertiary functions.

Figures 14-2 and 14-3 show the transmit operation waveforms of the synchronous serial ports for clock type 0 and clock type 1, respectively (8-bit length, LSB first, clock types 0 and 1).

Figure 14-2 Transmit Operation Waveforms of Synchronous Serial Port for Clock Type 0 (8-bit Length, LSB first)

Figure 14-3 Transmit Operation Waveforms of Synchronous Serial Port for Clock Type 1 (8-bit Length, LSB first)

14.3.2 Receive Operation

When “0” is written to the S0MD1 bit and “1” is written to the S0MD0 bit of the serial mode register (SIO0MOD0), this LSI is set to a receive mode.

When the S0EN bit of the serial port control register (SIO0CON) is set to “1”, reception starts. When reception of 8/16-bit data terminates, a synchronous serial port interrupt (SIO0INT) occurs and the S0EN bit is set to “0”.

Receive data is input from the tertiary function pins (P40/SIN0 or P44/SIN0) of GPIO.

When an internal clock is selected in the serial port mode register (SIO0MD1), the LSI is set to a master mode and when an external clock (P41/SCK0 or P45/SCK0) is selected, the LSI is set to a slave mode.

The serial port mode register (SIO0MOD0) enables selection of MSB first or LSB first.

The receive data input pin (P40/SIN0 or P44/SIN0) and transfer clock input/output pin (P41/SCK0 or P45/SCK0) must be set to the tertiary function.

Figures 14-4 and 14-5 show the receive operation waveforms of the synchronous serial ports for clock type 0 and clock type 1, respectively (8-bit length, MSB first, clock types 0 and 1).

Figure 14-4 Receive Operation Waveforms of Synchronous Serial Port for Clock Type 0 (8-bit Length, MSB first)

Figure 14-5 Receive Operation Waveforms of Synchronous Serial Port for Clock Type 1 (8-bit Length, MSB first)

Note:

When the SOUT0 pin is set to the tertiary function output in receive mode, a “H” level is output from the SOUT0 output pin.

14.3.3 Transmit/Receive Operation

When “1” is written to the S0MD1 bit and “1” is written to the S0MD0 bit of the serial mode register (SIO0MOD0), this LSI is set to a transmit/receive mode.

When the S0EN bit of the serial port control register (SIO0CON) is set to “1”, transmission/reception starts. When transmission/reception of 8/16-bit data terminates, a synchronous serial port interrupt (SIO0INT) occurs and the S0EN bit is set to “0”.

Receive data is input from the tertiary function pins (P40/SIN0 or P44/SIN0) of GPIO, and transmit data is output from the tertiary function pins (P42/SOUT0 or P46/SOUT0) of GPIO

When an internal clock is selected in the serial port mode register (SIO0MD1), the LSI is set to a master mode and when an external clock (P41/SCK0 or P45/SCK0) is selected, the LSI is set to a slave mode.

The serial port mode register (SIO0MOD0) enables selection of MSB first or LSB first.

The receive data input pin (P40/SIN0 or P44/SIN0), the transmit data output pin (P42/SOUT0 or P46/SOUT0), and transfer clock input/output pin (P41/SCK0 or P45/SCK0) must be set to the tertiary function.

Figure 14-6 shows the transmit/receive operation waveforms of the synchronous serial port (16-bit length, LSB first, clock types 0).

Figure 14-6 Transmit/Receive Operation Waveforms of Synchronous Serial Port (16-bit Length, LSB first, Clock Type 0)

14.4 Specifying port registers

When you want to make sure the SSIO function is working, please check related port registers are specified. See Chapter 22, "Port 4" for detail about the port registers.

14.4.1 Functioning P42 (SOUT0), P41 (SCK0) and P40 (SIN0) as the SSIO/ "Master mode"

Set P42MD1-P40MD1 bits(bit2-bit0 of P4MOD1 register) to "1" and set P42MD0-P40MD0(bit2-bit0 of P4MOD0 register) to "0", for specifying the SSIO as the secondary function of P42, P41 and P40.

Reg. name	P4MOD1 register (Address: 0F225H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47MD1	P46MD1	P45MD1	P44MD1	P43MD1	P42MD1	P41MD1	P40MD1
Data	*	*	*	*	*	1	1	1

Reg. name	P4MOD0 register (Address: 0F224H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47MD0	P46MD0	P45MD0	P44MD0	P43MD0	P42MD0	P41MD0	P40MD0
Data	*	*	*	*	*	0	0	0

Set P42C1-P41MC1 bits(bit2-bit1 of P4CON1 register) to "1", set P42C0-P41C0 bits(bit2-bit1 of P4CON0 register) to "1", and set P42DIR-P41DIR bits(bit2-bit1 of P4DIR register) to "0", for specifying the P42-P41 as CMOS output.

Set P40DIR bit(bit0 of P4DIR register) to "1" for specifying the P40 as an input pin.

Data setting to P40C1 bit and P40C0 bit depend on the application circuit connected to P40.

Reg. name	P4CON1 register (Address: 0F223H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47C1	P46C1	P45C1	P44C1	P43C1	P42C1	P41C1	P40C1
Data	*	*	*	*	*	1	1	\$

Reg. name	P4CON0 register (Address: 0F222H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47C0	P46C0	P45C0	P44C0	P43C0	P42C0	P41C0	P40C0
Data	*	*	*	*	*	1	1	\$

Reg. name	P4DIR register (Address: 0F221H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47DIR	P46DIR	P45DIR	P44DIR	P43DIR	P42DIR	P41DIR	P40DIR
Data	*	*	*	*	*	0	0	1

Data of P42D-P40D bits (bit2-0 of P4D register) do not affect to the SSIO function, so don't care the data for the function.

Reg. name	P4D register (Address: 0F220H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47D	P46D	P45D	P44D	P43D	P42D	P41D	P40D
Data	*	*	*	*	*	**	**	**

* : Bit not related to the SSIO function

** : Don't care the data

\$: Arbitrarily

14.4.2 Functioning P42 (SOUT0), P41 (SCK0) and P40 (SIN0) as the SSIO/ "Slave mode"

Set P42MD1-P40MD1 bits(bit2-bit0 of P4MOD1 register) to "1" and set P42MD0-P40MD0(bit2-bit0 of P4MOD0 register) to "0", for specifying the SSIO as the secondary function of P42, P41 and P40. They are the same setting as those in the case of master mode.

Reg. name	P4MOD1 register (Address: 0F225H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47MD1	P46MD1	P45MD1	P44MD1	P43MD1	P42MD1	P41MD1	P40MD1
Data	*	*	*	*	*	1	1	1

Reg. name	P4MOD0 register (Address: 0F224H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47MD0	P46MD0	P45MD0	P44MD0	P43MD0	P42MD0	P41MD0	P40MD0
Data	*	*	*	*	*	0	0	0

Set P42C1 bit(bit2 of P4CON1 register) to "1", set P42C0 bit(bit2 of P4CON0 register) to "1", and set P42DIR bit(bit2 of P4DIR register) to "0", for specifying the P42 as CMOS output.

Set P41DIR-P40DIR bits(bit1-0 of P4DIR register) to "1" for specifying the P41 and P40 as input pins.

Data setting to P41C1 bit, P40C1 bit, P41C0 bit and P40C0 bit, depend on the application circuit connected to P41 and P40.

Reg. name	P4CON1 register (Address: 0F223H)							
Bit	7	6	5	4	3	2	1	0

Chapter 15

UART

15. UART

15.1 Overview

This LSI includes 1 channel of UART (Universal Asynchronous Receiver Transmitter) which is an asynchronous serial interface.

For the input clock, see Chapter 6, "Clock Generation Circuit".

The use of UART requires setting of the secondary functions of Port 4. For setting of the secondary functions of Port 4, see Chapter 22, "Port 4".

15.1.1 Features

- 5-bit/6-bit/7-bit/8-bit data length selectable
- Odd parity, even parity, or no parity selectable
- 1 stop bit or 2 stop bits selectable
- Provided with parity error flag, overrun error flag, framing error flag, and transmit buffer status flag.
- Positive logic or negative logic selectable as communication logic
- LSB first or MSB first selectable as a communication direction
- Communication speed: Settable within the range of 200bps to 115200bps
- Built-in baud rate generator

15.1.2 Configuration

Figure 15-1 shows the configuration of the UART.

Figure 15-1 Configuration of UART

15.1.3 List of Pins

Pin name	I/O	Description
P02/RXD0	I	UART0 data input pin Used for the secondary function of the P02 pin.
P42/RXD0	I	UART0 data input pin Used for the secondary function of the P42 pin.
P43/TXD0	O	UART0 data output pin Used for the secondary function of the P43 pin.

15.2 Description of Registers

15.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F290H	UART0 transmit/receive buffer	UA0BUF	—	R/W	8	00H
0F291H	UART0 control register	UA0CON	—	R/W	8	00H
0F292H	UART0 mode register 0	UA0MOD0	UA0MOD	R/W	8/16	00H
0F293H	UART0 mode register 1	UA0MOD1		R/W	8	00H
0F294H	UART0 baud rate register L	UA0BRTL	UA0BRT	R/W	8/16	00H
0F295H	UART0 baud rate register H	UA0BRTH		R/W	8	00H
0F296H	UART0 status register	UA0STAT	—	R/W	8	00H

15.2.2 UART0 Transmit/Receive Buffer (UA0BUF)

Address: 0F290H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
UA0BUF	U0B7	U0B6	U0B5	U0B4	U0B3	U0B2	U0B1	U0B0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

UA0BUF is a special function register (SFR) to store the transmit/receive data of the UART.

In transmit mode, write transmission data to UA0BUF. To transmit data continuously, write the next data to UA0BUF after making sure that the U0FUL flag of the UART0 status register (UA0STAT) is "0". Any value written to UA0BUF can be read.

In receive mode, since data received at termination of reception is stored in UA0BUF, read the contents of UA0BUF using the UART0 interrupt at termination of reception. At continuous reception, UA0BUF is updated whenever reception terminates. Any write to UA0BUF is disabled in receive mode.

The bits not required when 5-bit, 6-bit, 7-bit, or 8-bit data length is selected become invalid in transmit mode and are set to "0" in receive mode.

Note:

For operation in transmit mode, be sure to set the transmit mode (UA0MOD0 and UA0MOD1) before setting transmit data in UA0BUF.

15.2.3 UART0 Control Register (UA0CON)

Address: 0F291H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
UA0CON	—	—	—	—	—	—	—	U0EN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

UA0CON is a special function register (SFR) to start/stop communication of the UART.

[Description of Bits]

- **U0EN (bit 0)**

The U0EN bit is used to specify the UART communication operation start. When U0EN is set to “1”, UART communication starts. In transmit mode, this bit is automatically set to “0” at termination of transmission. In receive mode, receive operation is continued. To terminate reception, set the bit to “0” by software.

U0EN	Description
0	Stops communication. (Initial value)
1	Starts communication.

15.2.4 UART0 Mode Register 0 (UA0MOD0)

Address: 0F292H

Access: R/W

Access size: 8/16 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
UA0MOD0	—	—	—	U0RSEL	—	U0CK1	U0CK0	U0IO
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

UA0MOD0 is a special function register (SFR) to set the transfer mode of the UART.

[Description of Bits]

- **U0IO** (bit 0)

The U0IO bit is used to select transmit or receive mode.

U0IO	Description
0	Transmit mode (initial value)
1	Receive mode

- **U0CK1, U0CK0** (bits 2, 1)

The U0CK1 and U0CK0 bits are used to select the clock to be input to the baud rate generator of the UART0.

U0CK1	U0CK0	Description
0	0	LSCLK (initial value)
0	1	LSCLK×2
1	*	HSCLK

- **U0RSEL** (bit 4)

The U0RSEL bit is used to select the receive data input pin for the UART0.

U0RSEL	Description
0	Selects the P02 pin. (Initial value)
1	Selects the P42 pin.

Notes:

- Always set the UA0MOD0 register while communication is stopped, and do not rewrite it during communication.
- When specifying LSCLK×2 for the clock, enable the operation of the 2×low-speed clock by setting bit 2 (ENMLT) of the frequency control register 1 (FCON1) to "1".
- When selecting the P42 pin as the receive data input pin, it is necessary to configure settings for the Port 4 secondary functions. For the details of the Port 4 secondary function settings, see Chapter 22, "Port 4".

15.2.5 UART0 Mode Register 1 (UA0MOD1)

Address: 0F293H

Access: R/W

Access size: 8/16 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
UA0MOD1	—	U0DIR	U0NEG	U0STP	U0PT1	U0PT0	U0LG1	U0LG0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

UA0MOD1 is a special function register (SFR) to set the transfer mode of the UART.

[Description of Bits]

- **U0LG1, U0LG0** (bits 1, 0)

The U0LG1 and U0LG0 bits are used to specify the data length in the communication of the UART.

U0LG1	U0LG0	Description
0	0	8-bit length (initial value)
0	1	7-bit length
1	0	6-bit length
1	1	5-bit length

- **U0PT1, U0PT0** (bits 3, 2)

The U0PT1 and U0PT0 bits are used to select “even parity”, odd parity”, or “no parity” in the communication of the UART.

U0PT1	U0PT0	Description
0	0	Even parity (initial value)
0	1	Odd parity
1	*	No parity bit

- **U0STP** (bit 4)

The U0STP bit is used to select the stop bit length in the communication of the UART.

U0STP	Description
0	1 stop bit (initial value)
1	2 stop bits

- **U0NEG** (bit 5)

The U0NEG bit is used to select positive logic or negative logic in the communication of the UART.

U0NEG	Description
0	Positive logic (initial value)
1	Negative logic

- **U0DIR** (bit 6)

The U0DIR bit is used to select LSB first or MSB first in the communication of the UART.

U0DIR	Description
0	LSB first (initial value)
1	MSB first

Note:

Always set the UA0MOD1 register while communication is stopped, and do not rewrite it during communication.

15.2.6 UART0 Baud Rate Registers L, H (UA0BRTL, UA0BRTH)

Address: 0F294H
Access: R/W
Access size: 8/16 bits
Initial value: 0FFH

	7	6	5	4	3	2	1	0
UA0BRTL	U0BR7	U0BR6	U0BR5	U0BR4	U0BR3	U0BR2	U0BR1	U0BR0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	1	1	1	1	1	1	1	1

Address: 0F295H
Access: R/W
Access size: 8 bits
Initial value: 0FH

	7	6	5	4	3	2	1	0
UA0BRTH	—	—	—	—	U0BR11	U0BR10	U0BR9	U0BR8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	1	1	1	1

UA0BRTL and UA0BRTH are special function registers (SFRs) to set the count value of the baud rate generator which generates baud rate clocks.

For the relationship between the count value of the baud rate generator and baud rate, see Section 15.3.2, “Baud Rate”.

Note:

Always set the UA0BRTL and UA0BRTH registers while communication is stopped, and do not rewrite them during communication.

15.2.7 UART0 Status Register (UA0STAT)

Address: 0F296H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
UA0STAT	—	—	—	—	U0FUL	U0PER	U0OER	U0FER
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

UA0STAT is a special function register (SFR) to indicate the state of transmit or receive operation of the UART. When any data is written to UA0STAT, all the flags are initialized to “0”.

[Description of Bits]

- **U0FER** (bit 0)

The U0FER bit is used to indicate occurrence of a framing error of the UART.

When an error occurs in the start or stop bit, the U0FER bit is set to “1”. This bit is updated each time reception is completed.

The U0FER bit is fixed to “0” in transmit mode.

U0FER	Description
0	No framing error (initial value)
1	Framing error

- **U0OER** (bit 1)

The U0OER bit is used to indicate occurrence of an overrun error of the UART.

If the received data in the transmit/receive buffer (UA0BUF) is received again before it is read, this bit is set to “1”. Even if reception is stopped by the U0EN bit and then reception is restarted, this bit is set to “1” unless the previous receive data is not read. Therefore, make sure that data is always read from the transmit/receive buffer even if the data is not required.

The U0OER bit is fixed to “0” in transmit mode.

U0OER	Description
0	No overrun error (initial value)
1	Overrun error

- **U0PER** (bit 2)

The U0PER bit is used to indicate occurrence of a parity error of the UART.

When the parity of the received data and the parity bit attached to the data do not coincide, this bit is set to “1”. U0PER is updated whenever data is received.

The U0PER bit is fixed to “0” in transmit mode.

U0PER	Description
0	No parity error (initial value)
1	Parity error

- **U0FUL (bit 3)**

The U0FUL bit is used to indicate the state of the transmit/receive buffer of the UART.

When transmit data is written in UA0BUF in transmit mode, this bit is set to “1” and when transmit data is transferred to the shift register, this bit is set to “0”. To transmit data consecutively, write the next transmit data to UA0BUF after checking that the U0FUL flag has been set to “0”.

The U0FUL bit is fixed to “0” in receive mode.

U0FUL	Description
0	There is no data in the transmit/receive buffer. (Initial value)
1	There is data in the transmit/receive buffer.

15.3 Description of Operation

15.3.1 Transfer Data Format

In the transfer data format, one frame contains a start bit, a data bit, a parity bit, and a stop bit. In this format, 5 to 8 bits can be selected as data bit. For the parity bit, “with parity bit”, “without parity bit”, “even parity”, or “odd parity” can be selected. For the stop bit, “1 stop bit” or “2 stop bits” are available and for the transfer direction, “LSB first” or “MSB first” are available for selection. For serial input/output logic, positive logic or negative logic can be selected. All these options are set with the UART0 mode register (UA0MOD1). Figure 15-2 and Figure 15-3 show the positive logic input/output format and negative logic input/output format, respectively.

Figure 15-2 Positive Logic Input/Output Format

Figure 15-3 Negative Logic Input/Output Format

15.3.2 Baud Rate

Baud rates are generated by the baud generator.

The baud rate generator generates a baud rate by counting the clock selected by the baud rate clock selection bits (U0CK1, U0CK0) of the UART0 mode register 0 (UA0MOD0). The count value of the baud rate generator can be set by writing it in the UART0 baud rate register H or L (UA0BRTH, UA0BRTL). The maximum count is 4096.

The setting values of UA0BRTH and UA0BRTL are expressed by the following equation.

$$\text{UA0BRTH, L} = \frac{\text{Clock frequency (Hz)}}{\text{Baud rate (bps)}} - 1$$

Table 15-2 lists the count values for typical baud rates.

Table 15-2 Count Values for Typical Baud Rates

Baud rate	Baud rate generator clock selection			Count value of the baud rate generator			
	Baud rate clock	U0CK1	U0CK0	Count value	Period of 1 bit	UA0BRTH	UA0BRTL
1200 bps	32.768 kHz	0	0	27	Approx. 824 μs	00H	1AH
2400 bps	65.536 kHz	0	1	27	Approx. 412 μs	00H	1AH
4800 bps	4.096 MHz	1	*	853	Approx. 208 μs	03H	054H
9600 bps	4.096 MHz	1	*	427	Approx. 104 μs	01H	0AAH
19200 bps	4.096 MHz	1	*	213	Approx. 52 μs	00H	0D4H
38400 bps	4.096 MHz	1	*	107	Approx. 26 μs	00H	06AH
57600 bps	4.096 MHz	1	*	71	Approx. 17.3 μs	00H	046H
115200 bps	4.096 MHz	1	*	36	Approx. 8.8 μs	00H	023H

Note:

When UA0BRTH or UA0BRTL is set to a value equal to less than "0007H", the value set is read from UA0BRTH or UA0BRTL but the value of the baud rate clock counter is the same as the value when UA0BRTH or UA0BRTL is set to "0008H".

When specifying 65.536 kHz (LSCLK×2) for the clock, enable the operation of the 2×low-speed clock by setting bit 2 (ENMLT) of the frequency control register 1 (FCON1) to "1".

Compensating tolerant of RC oscillation 500kHz with Timer can support errors of +/- 2% or less at 9600bps. See Section 10.3.2., "Frequency measurement mode".

15.3.3 Transmit Data Direction

Figure 15-4 shows the relationship between the transmit/receive buffer and the transmit/receive data.

Figure 15-4 Relationship between Transmit/Receive Buffer and Transmit/Receive Data

Note:

When the TXD0 pin is set to serve the secondary function output in receive mode, "H" level is output from the TXD0 pin.

15.3.4 Transmit Operation

Transmission is started by setting the U0IO bit of the UART0 mode register 0 (UA0MOD0) to “0” to select transmit mode and setting the U0EN bit of the UART0 control register (UA0CON) to “1”.

Figure 15-5 shows the operation timing for transmission.

When the U0EN bit is set to “1” (①), the baud rate generator generates an internal transfer clock of the baud rate set and starts transmission.

The start bit is output to the TXD0 pin by the falling edge of the internal transfer clock (②). Subsequently, transmit data, a parity bit, and a stop bit are output.

When the start bit is output (②), a UART0 interrupt is requested. In the UART0 interrupt routine, the next data to be transmitted is written to the transmit/receive buffer (UA0BUF).

When the next data to be transmitted is written to the transmit/receive buffer (UA0OBUF), the transmit buffer status flag (U0FUL) is set to “1” (③) and a UART0 interrupt is requested on the falling edge of the internal transfer clock (④) after transmission of the stop bit. If the UART0 interrupt routine is terminated without writing the next data to the transmit/receive buffer, the U0FUL bit is not set to “1” (⑤) and transmission continues up to the transmission of the stop bit, then the U0EN bit is reset to “0” and a UART0 interrupt is requested.

The valid period for the next transmit data to be written to the transmit/receive buffer is from the generation of an interrupt to the termination of stop bit transmission. (⑥)

Figure 15-5 Operation Timing in Transmission

15.3.5 Receive Operation

Reception is started by selecting a receive data input pin using the U0RSEL bit of the UART0 mode register 0 (UA0MOD0), then setting the U0IO bit of UA0MOD0 to "0" to select receive mode, and then setting the U0EN bit of the UART0 control register (UA0CON) to "1".

Figure 15-6 shows the operation timing for reception.

When receive operation starts, the LSI checks the data sent to the input pin RXD0 and waits for the arrival of a start bit. When detecting a start bit (㉔), the LSI generates the internal transfer clock of the baud rate set with the start bit detect point as a reference and performs receive operation.

The shift register shifts in the data input to RXD on the rising edge of the internal transfer clock. The data and parity bit are shifted into the shift register and 5- to 8- bit receive data is transferred to the transmit/receive buffer (UA0BUF) concurrently with the fall of the internal transfer clock of ㉕.

The LSI requests a UART0 interrupt on the rising edge of the internal transfer clock subsequent to the internal transfer clock by which the receive data was fetched (㉖) and checks for a stop bit error and a parity bit error. When an error is detected, the LSI sets the corresponding bit of the UART0 status register (UA0STAT) to "1".

Parity error	: S0PER = "1"
Overrun error	: S0OER = "1"
Framing error	: S0FER = "1"

As shown in Figure 15-6, the rise of the internal transfer clock is set so that it may fall into the middle of the bit interval of the receive data.

Reception continues until the U0EN bit is reset to "0" by the program. When the U0EN bit is reset to "0" during reception, the data received may be destroyed. When the U0EN bit is reset to "0" during the "U0EN reset enable period" in Figure 15.6, the data received is protected.

Figure 15-6 Operation Timing in Reception

15.4 Specifying port registers

When you want to make sure the UART function is working, please check related port registers are specified. See Chapter 22, "Port 4" and Chapter 18, "Port 0" for detail about the port registers.

15.4.1 Functioning P43(TXD0) and P42(RXD0) as the UART.

Set P43MD1-P42MD1 bits(bit3-bit2 of P4MOD1 register) to "0" and set P43MD0-P42MD0(bit3-bit2 of P4MOD0 register) to "1", for specifying the UART as the secondary function of P43 and P42.

Reg. name	P4MOD1 register (Address: 0F225H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47MD1	P46MD1	P45MD1	P44MD1	P43MD1	P42MD1	P41MD1	P40MD1
Data	*	*	*	*	0	0	*	*

Reg. name	P4MOD0 register (Address: 0F224H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47MD0	P46MD0	P45MD0	P44MD0	P43MD0	P42MD0	P41MD0	P40MD0
Data	*	*	*	*	1	1	*	*

Set P43C1 bit(bit3 of P4CON1 register) to "1", set P43C0 bit(bit3 of P4CON0 register) to "1", and set P43DIR bit(bit3 of P4DIR register) to "0", for specifying the P43 as CMOS output.

Set P42DIR bit(bit2 of P4DIR register) to "1" for specifying the P42 as an input pin.

Data setting to P42C1 bit and P42C0 bit, depend on the application circuit connected to P42.

Reg. name	P4CON1 register (Address: 0F223H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47C1	P46C1	P45C1	P44C1	P43C1	P42C1	P41C1	P40C1
Data	*	*	*	*	1	\$	*	*

Reg. name	P4CON0 register (Address: 0F222H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47C0	P46C0	P45C0	P44C0	P43C0	P42C0	P41C0	P40C0
Data	*	*	*	*	1	\$	*	*

Reg. name	P4DIR register (Address: 0F221H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47DIR	P46DIR	P45DIR	P44DIR	P43DIR	P42DIR	P41DIR	P40DIR
Data	*	*	*	*	0	1	*	*

Data of P43D-P42D bits (bit3-2 of P4D register) do not affect to the UART function, so don't care the data for the function.

Reg. name	P4D register (Address: 0F220H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47D	P46D	P45D	P44D	P43D	P42D	P41D	P40D
Data	*	*	*	*	**	**	*	*

* : Bit not related to the UART(using P43 and P42) function

** : Don't care the data

\$: Arbitrarily

Note:

The receive pin (RXD) is selected by U0RSEL bit(bit4 of UA0MOD0 register). Resetting the bit to "0" (initial value) selects P02 pin and setting the bit to "1" selects P43 pin.

15.4.2 Functioning P43(TXD0) and P02(RXD0) as the UART.

Set P43MD1 bit(bit3 of P4MOD1 register) to "0" and set P43MD0(bit3 of P4MOD0 register) to "1", for specifying the UART as the secondary function of P43.

Reg. name	P4MOD1 register (Address: 0F225H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47MD1	P46MD1	P45MD1	P44MD1	P43MD1	P42MD1	P41MD1	P40MD1
Data	*	*	*	*	0	\$	*	*

Reg. name	P4MOD0 register (Address: 0F224H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47MD0	P46MD0	P45MD0	P44MD0	P43MD0	P42MD0	P41MD0	P40MD0
Data	*	*	*	*	1	\$	*	*

Set P43C1 bit(bit3 of P4CON1 register) to "1", set P43C0 bit(bit3 of P4CON0 register) to "1", and set P43DIR bit(bit3 of P4DIR register) to "0", for specifying the P43 as CMOS output.

Reg. name	P4CON1 register (Address: 0F223H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47C1	P46C1	P45C1	P44C1	P43C1	P42C1	P41C1	P40C1
Data	*	*	*	*	1	*	*	*

Reg. name	P4CON0 register (Address: 0F222H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47C0	P46C0	P45C0	P44C0	P43C0	P42C0	P41C0	P40C0
Data	*	*	*	*	1	*	*	*

Reg. name	P4DIR register (Address: 0F221H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47DIR	P46DIR	P45DIR	P44DIR	P43DIR	P42DIR	P41DIR	P40DIR
Data	*	*	*	*	0	*	*	*

Data of P43D bit (bit3 of P4D register) do not affect to the UART function, so don't care the data for the function.

Reg. name	P4D register (Address: 0F220H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47D	P46D	P45D	P44D	P43D	P42D	P41D	P40D
Data	*	*	*	*	**	*	*	*

P02 is an input-only port, so there is no need to specify data direction (i.e. input or output).
Data setting to P02C1 bit and P02C0 bit, depend on the application circuit connected to P02.

Reg. name	P0CON1 register (Address: 0F207H)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	P03C1	P02C1	P01C1	P00C1
Data	-	-	-	-	*	\$	*	*

Reg. name	P0CON0 register (Address: 0F206H)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	P03C0	P02C0	P01C0	P00C0
Data	-	-	-	-	*	\$	*	*

Data of P02D bit (bit2 of P0D register) do not affect to the UART function, so don't care the data for the function.

Reg. name	P0D register (Address: 0F204H)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	P03D	P02D	P01D	P00D
Data	-	-	-	-	*	**	*	*

* : Bit not related to the UART(using P43 and P02) function

** : Don't care the data

\$: Arbitrarily

Note:

The receive pin (RXD0) is selected by U0RSEL bit(bit4 of UA0MOD0 register). Setting the bit to "0" (initial value) selects P02 pin and setting the bit to "1" selects P43 pin.

Even if P42 is specified as RXD0 by P42MD1 bit, P42MD0 bit, P42C1 bit, P42C0 bit and P42IDR bit, setting "0" to U0RSEL bit has priority to select P02 pin as the RXD0.

P02(Port 0) is an input-only port, does not have registers that can select data direction(input or output) or mode(primary or secondary function).

Chapter 16

I²C Bus Interface

16. I²C Bus Interface

16.1 Overview

This LSI includes 1 channel of I²C bus interface (master).

The secondary functions of Port 4 are assigned to the I²C bus interface data input/output pin and the I²C bus interface clock input/output pin. For Port4, see Chapter 22, "Port 4".

16.1.1 Features

- Master function
- Communication speeds supported include standard mode (100 kbps@1MHz HSCLK, 50kbps@500kHz HSCLK) and fast mode (400kbps@ 4MHz HSCLK).
- 7-bit address format (10-bit address can be supported)

Note:

This LSI does not support arbitration function (multi-master) and clock synchronization (handshake).

16.1.2 Configuration

Figure 16-1 shows the configuration of the I²C bus interface.

Figure 16-1 Configuration of I²C Bus Interface

16.1.3 List of Pins

Pin name	I/O	Description
P40/SDA	I/O	I ² C bus interface data input/output pin. Used for the secondary function of the P40 pin.
P41/SCL	I/O	I ² C bus interface clock input/output pin. Used for the secondary function of the P41 pin.

16.2 Description of Registers

16.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F2A0H	I ² C bus 0 receive register	I2C0RD	—	R	8	00H
0F2A1H	I ² C bus 0 slave address register	I2C0SA	—	R/W	8	00H
0F2A2H	I ² C bus 0 transmit data register	I2C0TD	—	R/W	8	00H
0F2A3H	I ² C bus 0 control register	I2C0CON	—	R/W	8	00H
0F2A4H	I ² C bus 0 mode register	I2C0MOD	—	R/W	8	00H
0F2A5H	I ² C bus 0 status register	I2C0STAT	—	R	8	00H

16.2.2 I²C Bus 0 Receive Register (I2C0RD)

Address: 0F2A0H

Access: R

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
I2C0RD	I20R7	I20R6	I20R5	I20R4	I20R3	I20R2	I20R1	I20R0
R	R	R	R	R	R	R	R	R
Initial value	0	0	0	0	0	0	0	0

I2C0RD is a read-only special function register (SFR) to store receive data.

I2C0RD is updated after completion of each reception.

[Description of Bits]

- **I20R7-I20R0** (bits 7-0)

The I20R7 to I20R0 bits are used to store receive data. The signal input to the SDA pin is received at transmission of a slave address and at data transmission/reception in sync with the rising edge of the signal on the SCL pin. Since data that has been output to the SDA and SCL pins is received not only at data reception but also at slave address data transmission and data transmission, it is possible to check whether transmit data has certainly been transmitted.

16.2.3 I²C Bus 0 Slave Address Register (I2C0SA)

Address: 0F2A1H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
I2C0SA	I20A6	I20A5	I20A4	I20A3	I20A2	I20A1	I20A0	I20RW
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

I2C0SA is a special function register (SFR) to set the address and the transmit/receive mode of the slave device.

[Description of Bits]

- **I20RW** (bit 0)

The I20RW bit is used to select the data transmit mode (write) or data receive mode (read).

I20RW	Description
0	Data transmit mode (initial value)
1	Data receive mode

- **I20A6-I20A0** (bits 7-1)

The I20A6 to I20A0 bits are used to set the address of the communication destination.

16.2.4 I²C Bus 0 Transmit Data Register (I2C0TD)

Address: 0F2A2H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
I2C0TD	I20T7	I20T6	I20T5	I20T4	I20T3	I20T2	I20T1	I20T0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

I2C0TD is a special function register (SFR) to set transmit data.

[Description of Bits]

- **I20T7-0** (bits 7-0)

The I20T7 to 0 bits are used to set transmit data.

16.2.5 I²C Bus 0 Control Register (I2C0CON)

Address: 0F2A3H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
I2C0CON	I2OACT	—	—	—	—	I2ORS	I2OSP	I2OST
R/W	R/W	R/W	R/W	R/W	R/W	W	W	R/W
Initial value	0	0	0	0	0	0	0	0

I2C0CON is a special function register (SFR) to control transmit and receive operations.

[Description of Bits]

- **I2OST** (bit 0)

The I2OST bit is used to control the communication operation of the I²C bus interface. When the I2OST bit is set to “1”, communication starts. When “1” is overwritten to the I2OST bit in a control register setting wait state after transmission/reception of acknowledgment, communication starts again. When the I2OST bit is set to “0”, communication is stopped forcibly.

The I2OST bit can be set to “1” only when the I2C bus interface is in an operation enable state (I2OEN = “1”).

When the I2OSP bit is set to “1”, the I2OST bit is set to “0”.

I2OST	Description
0	Stops communication (initial value)
1	Starts communication

- **I2OSP** (bit 1)

The I2OSP bit is a write-only bit used to request a stop condition. When the I2OSP bit is set to “1”, the I²C bus shifts to the stop condition and communication stops. When the I2OSP bit is read, “0” is always read.

I2OSP	Description
0	No stop condition request (initial value)
1	Stop condition request

- **I2ORS** (bit 2)

The I2ORS bit is a write-only bit used to request a repeated start. When this bit is set to “1” during data communication, the I²C bus shifts to the repeated start condition and communication restarts from the slave address. I2ORS can be set to “1” only while communication is active (I2OST = “1”). When the I2ORS bit is read, “0” is always read.

I2ORS	Description
0	No repeated start request (initial value)
1	Repeated start request

- **I2OACT** (bit 7)

The I2OACT bit is used to set the acknowledge signal to be output at completion of reception.

I2OACT	Description
0	Acknowledgment data “0” (initial value)
1	Acknowledgment data “1”

Note:

In the case of a multi-master, check that the I²C bus is in a free state by using the I2OBB flag of I2C0STAT and start communication.

16.2.6 I²C Bus 0 Mode Register (I2C0MOD)

Address: 0F2A4H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
I2C0MOD	—	—	—	I20SYN	I20DW1	I20DW0	I20MD	I20EN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

I2C0MOD is a special function register (SFR) to set operating mode.

[Description of Bits]

- **I20EN** (bit 0)

The I20EN bit is used to enable the operation of the I²C bus interface. Only when the I20EN bit is set to “1”, the I20ST bit can be set and the I20BB flag starts operation. When the I20EN bit is set to “0”, all the SFRs related to the I²C bus 0 are initialized.

I20EN	Description
0	Stops I ² C operation. (Initial value)
1	Enables I ² C operation.

- **I20MD** (bit 1)

The I20MD bit is used to set the communication speed of the I²C bus interface. Standard mode or fast mode can be selected.

I20MD	Description
0	Standard mode (initial value)/ 100kbps@1MHz HSCLK
1	Fast mode / Max. 400kbps@4MHz HSCLK

- **I20DW1, I20DW0** (bits 3, 2)

The I20DW1 and I20DW0 bits are used to set the communication speed reduction rate of the I²C bus interface. Set this bit so that the communication speed does not exceed 100kbps/400kbps.

I20DW1	I20DW0	Description
0	0	No communication speed reduction (initial value)
0	1	10% communication speed reduction
1	0	20% communication speed reduction
1	1	30% communication speed reduction

- **I20SYN** (bit 4)

The I20SYN bit is used to select whether or not to use the clock synchronization function (handshake function).

Note: This LSI does not support the clock synchronization function or multi-master. Please always set the bit to “1”.

I20SYN	Description
0	Clock synchronization is not used. (Initial value)
1	Do not use.

Note:

The I²C bus is set so that the communication speed may become 100kbps/400kbps when HSCLK is 4 MHz. Therefore, when using PLL oscillation (approx. 8.192 MHz) for high-speed oscillation, select 1/2HSCLK at selection of the HSCLK frequency of FCON0 and select 10% communication speed reduction at selection of I2C0MOD communication speed reduction. When 500 kHz RC oscillation is used, communication in standard mode (50kbps) is available with the fast mode by setting I20MD bit to “1”.

16.2.7 I²C Bus 0 Status Register (I2C0STAT)

Address: 0F2A5H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
I2C0STAT	—	—	—	—	—	I20ER	I20ACR	I20BB
R	R	R	R	R	R	R	R	R
Initial value:	0	0	0	0	0	0	0	0

I2C0STAT is a read-only special function register (SFR) to indicate the state of the I²C bus interface.

[Description of Bits]

- **I20BB** (bit 0)

The I20BB bit is used to indicate the state of use of the I²C bus interface. When the start condition is generated on the I²C bus, this bit is set to “1” and when the stop condition is generated, the bit is set to “0”. The I20BB bit is set to “0” when the I20EN bit of I2C0MOD is “0”.

I20BB	Description
0	I ² C bus-free state (Initial value)
1	I ² C bus-busy state

- **I20ACR** (bit 1)

The I20ACR bit is used to store the acknowledgment signal received. Acknowledgment signals are received each time the slave address is received and data transmission or reception is completed. The I20ACR bit is set to “0” when the I20EN bit of I2C0MOD is “0”.

I20ACR	Description
0	Receives acknowledgment “0”. (Initial value)
1	Receives acknowledgment “1”.

- **I20ER** (bit 2)

The I20ER bit is a flag to indicate a transmit error. When the value of the bit transmitted and the value of the SDA pin do not coincide, this bit is set to “1”. The SDA remains the output until the subsequent byte data communication terminates even if I20ER is set to “1”.

The I20ER bit is set to “0” when a write operation to I2C0CON is performed. The I20ER bit is set to “0” when the I20EN bit of I2C0MOD is set to “0”.

I20ER	Description
0	No transmit error (initial value)
1	Transmit error

16.3 Description of Operation

16.3.1 Communication Operating Mode

Communication is started when communication mode is selected by using the I²C bus 0 mode register (I2C0MOD), the I²C function is enabled by using the I20EN bit, a slave address and a data communication direction are set in the I²C bus 0 slave address register, and "1" is written to the I20ST bit of the I2C bus 0 control register (I2C0CON).

16.3.1.1 Start Condition

When "1" is written to the I20ST bit of the I²C bus 0 control register (I2C0CON) while communication is stopped (the I20ST bit is "0"), communication is started and the start condition waveform is output to the SDA and SCL pins.

After execution of the start condition, the LSI shifts to slave address transmit mode.

16.3.1.2 Repeated Start Condition

When "1" is written to the I20RS and I20ST bits of the I²C bus 0 control register (I2C0CON) during communication (the I20ST bit is "0"), the restart condition waveform is output to the SDA and SCL pins. If you want to continue the communication without making the stop condition, executing the repeated start condition enables to specify another slave addresses or change the data direction (transmit or receive) See Figure 16-4.

After execution of the repeated start condition, the LSI shifts to slave address transmit mode.

16.3.1.3 Slave Address Transmit Mode

In slave address transmit mode, the values (slave address and data communication direction) of the I²C bus 0 slave address register (I2C0SA) are transmitted in MSB first, and finally, the acknowledgment signal is received in the I20ACR bit of the I²C bus 0 status register (I2CSTAT). The I20ACR bit is reset to "0" when receiving an acknowledgment "0" and set to "1" when receiving an acknowledgment "1".

At completion of acknowledgment reception, the LSI shifts to the I²C bus 0 control register (I2C0CON) setting wait state (control register setting wait state).

The value of I2C0SA output from the SDA pin is stored in I2C0RD during aftermentioned Control Register Setting Wait State.

16.3.1.4 Data Transmit Mode

In data transmit mode, the value of I2C0TD is transmitted in MSB first, and finally, the acknowledgment signal is received in the I20ACR bit of the I²C bus 0 status register (I2CSTAT). The I20ACR bit is reset to "0" when receiving an acknowledgment "0" and set to "1" when receiving an acknowledgment "1".

At completion of acknowledgment reception, the LSI shifts to the I²C bus 0 control register (I2C0CON) setting wait state (control register setting wait state).

The value of I2C0TD output from the SDA pin is stored in I2C0RD.

16.3.1.5 Data Receive Mode

In data receive mode, the value input in the SDA pin is received synchronously with the rising edge of the serial clock output to the SCL pin, and finally, the value of the I20ACT bit of the I2C bus 0 control register (I2C0CON) is output as an acknowledge signal. For example, as shown in Figure 15-3 and Figure 15-4, the acknowledge slot after I20ACT bit is reset to "0" (I2CON="01H") will have the acknowledge "0" (Shown as "A" in the Figure). In the same way, the acknowledge slot after I20ACT bit is set to "1" (I2CON="81H") will have the non-acknowledge "1" (Shown as "A" in the Figure).

At completion of acknowledgment transmission, the LSI shifts to the I²C bus 0 control register (I2C0CON) setting wait state (control register setting wait state).

The data received is stored in I2C0RD after the acknowledgment signal is output. The acknowledgment signal output is received in the I20ACR bit of the I²C bus 0 status register (I2CSTAT).

16.3.1.6 Control Register Setting Wait State

When the LSI shifts to the control register setting wait state, an I²C bus interface interrupt (I2C0INT) is generated.

In the control register setting wait state, the transmit flag (I20ER) of the I²C bus 0 status register (I2C0STAT) and acknowledgment receive data (I20ACR) are confirmed and at data reception, the contents of I2C0RD are read in the CPU and the next operation mode is selected.

When “1” is written to the I2OST bit in the control register setting wait state, the LSI shifts to the data transmit or receive mode. When “1” is written to the I2OSP bit, the LSI shifts to the stop condition. When “1” is written to the I2ORS bit and I2OST bit, the operation shifts to the repeated start condition.

16.3.1.7 Stop Condition

In the stop condition, the stop condition waveform is output to the SDA and SCL pins. After the stop condition waveform is output, an I²C bus interface interrupt (I2C0INT) is generated.

16.3.2 Communication Operation Timing

Figures 16-2 to 16-4 show the operation timing and control method for each communication mode.

Figure 16-2 Operation Timing in Data Transmit (Write)

Figure 16-3 Operation Timing in Data Receive (Read)

Figure 16-4 Operation Timing at Data Transmit/Receive (Write/Read) Switching

Figure 16-5 shows the operation timing and control method when an acknowledgment error occurs.

Figure 16-5 Operation Suspend Timing at Occurrence of Acknowledgment Error

When the values of the transmitted bit and the SDA pin do not coincide, the I20ER bit of the I2C bus 0 status register (I2C0STAT) is set to "1" and SDA pin remains the output until termination of the subsequent byte data communication. I20ER bit is initialized to "0" by writing I²C Bus 0 Control Register (I2C0CON).

Figure 16-6 shows the operation timing and control method when transmission fails.

Figure 16-6 Operation Timing When Transmission Fails

16.3.3 Operation Waveforms

Figure 16-7 shows the operation waveforms of the SDA and SCL signals and the I20BB flag. Table 16-1 shows the relationship between communication speeds and HSCLK clock counts.

Figure 16-7 Operation Waveforms of SDA and SCL Signals and I20BB Flag

Table 16-1 Relationship between Communication Speeds and HSCLK Clock Counts

Communication speed (I20SP)	Speed reduction (I20DW1, 0)	t _{CYC}	t _{HD:STA}	t _{LOW}	t _{HD:DAT}	t _{HIGH}	t _{SU:STA}	t _{SU:DAT}	t _{SU:STO}	t _{BUF}
Standard mode 100 kb p s	No reduction	40φ	18φ	22φ	4φ	18φ	22φ	18φ	18φ	22φ
	10% reduction	44φ	20φ	24φ	4φ	20φ	24φ	20φ	20φ	24φ
	20% reduction	48φ	22φ	26φ	4φ	22φ	26φ	22φ	22φ	26φ
	30% reduction	52φ	24φ	28φ	4φ	24φ	28φ	24φ	24φ	28φ
Fast mode 400 kb p s	No reduction	10φ	4φ	6φ	2φ	4φ	6φ	4φ	4φ	6φ
	10% reduction	11φ	4φ	7φ	2φ	4φ	7φ	5φ	4φ	7φ
	20% reduction	12φ	5φ	7φ	2φ	5φ	7φ	5φ	5φ	7φ
	30% reduction	13φ	5φ	8φ	2φ	5φ	8φ	6φ	5φ	8φ

φ: Period of high-speed clock (HSCLK)

Note

The HSCLK clock count is set so that the communication speed may be set to 100kbps/400kbps when HSCLK is 4 MHz. When the high-speed clock frequency is not 4 MHz, select an I2C0MOD communication speed reduction rate and an FCON0 HSCLK frequency so that the communication speed may not exceed 100kbps/400kbps.

16.4 Specifying port registers

When you want to make sure the I2C bus interface function is working, please check related port registers are specified. See Chapter 22, “Port 4” for detail about the port registers.

16.4.1 Functioning P41(SCL) and P40(SDA) as the I2C

Set P41MD1-P40MD1 bits(bit1-bit0 of P4MOD1 register) to “0” and set P41MD0-P40MD0(bit1-bit0 of P4MOD0 register) to “1”, for specifying the I2C as the secondary function of P41 and P40.

Reg. name	P4MOD1 register (Address: 0F225H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47MD1	P46MD1	P45MD1	P44MD1	P43MD1	P42MD1	P41MD1	P40MD1
Data	*	*	*	*	*	*	0	0

Reg. name	P4MOD0 register (Address: 0F224H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47MD0	P46MD0	P45MD0	P44MD0	P43MD0	P42MD0	P41MD0	P40MD0
Data	*	*	*	*	*	*	1	1

Set P41C1-P40C1 bit(bit1-0 of P4CON1 register) to “1”, set P41C0-P40C0 bit(bit1-0 of P4CON0 register) to “0”, and set P41DIR-P40DIR bit(bit1-0 of P4DIR register) to “0”, for specifying the P41 and P40 as Nch open-drain output. The open-drain/open-collector outputs are required on the I2C bus line to avoid collision between H level and L level.

Reg. name	P4CON1 register (Address: 0F223H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47C1	P46C1	P45C1	P44C1	P43C1	P42C1	P41C1	P40C1
Data	*	*	*	*	*	*	1	1

Reg. name	P4CON0 register (Address: 0F222H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47C0	P46C0	P45C0	P44C0	P43C0	P42C0	P41C0	P40C0
Data	*	*	*	*	*	*	0	0

Reg. name	P4DIR register (Address: 0F221H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47DIR	P46DIR	P45DIR	P44DIR	P43DIR	P42DIR	P41DIR	P40DIR
Data	*	*	*	*	*	*	0	0

Data of P41D-P40D bits (bit1-0 of P4D register) do not affect to the I2C function, so don't care the data for the function.

Reg. name	P4D register (Address: 0F220H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47D	P46D	P45D	P44D	P43D	P42D	P41D	P40D
Data	*	*	*	*	*	*	**	**

* : Bit not related to the I2C bus interface function

** : Don't care the data

Chapter 17

NMI Pin

17. NMI Pin

17.1 Overview

This LSI includes an input port (NMI) which generates a non-maskable interrupt. For interrupts see Chapter 5, "Interrupts".

17.1.1 Features

- Non-maskable interrupt pin.
- Allows selection of an input with a pull-up resistor or a high-impedance input.
- Applies a noise filter to NMI interrupt (NMINT).

17.1.2 Configuration

Figure 17-1 shows the configuration of the NMI pin.

Figure 17-1 Configuration of NMI Pin

17.1.3 List of Pins

Pin name	Input/output	Description
NMI	I	Non-maskable interrupt input port

17.2 Description of Registers

17.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F200H	NMI data register	NMID	—	R	8	Depends on pin state
0F201H	NMI control register	NMICON	—	R/W	8	00H

17.2.2 NMI Data Register (NMID)

Address: 0F200H

Access: R

Access size: 8 bits

Initial value: Depends on the pin state

	7	6	5	4	3	2	1	0
NMID	—	—	—	—	—	—	—	NMI
R	R	R	R	R	R	R	R	R
Initial value	0	0	0	0	0	0	0	x

NMID is a read-only special function register (SFR) for reading the NMI pin level.

[Description of Bits]

- **NMI** (bit 0)

The NMI bit is used to read the level of the NMI pin.

NMI	Description
0	"0" level
1	"1" level

17.2.3 NMI Control Register (NMICON)

Address: 0F201H
Access: R/W
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
NMICON	—	—	—	—	—	—	—	NMIC
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

NMICON is a special function register (SFR) to select the input mode of the NMI pin.

[Description of Bits]

- **NMIC** (bit 0)

The NMIC bit is used to select the input mode with or without a pull-up resistor.

NMIC	Description
0	Input mode with a pull-up resistor (initial value)
1	High-impedance input mode

17.3 Description of Operation

The non-maskable NMI interrupt (NMIINT) is assigned to the NMI pin.

The NMI pin allows selection of an input mode with a pull-up resistor or a high-impedance input mode by using the NMI control register (NMICON). At a system reset, the input mode with a pull-up resistor is selected.

The level of the NMI pin can be read by reading the NMI data register (MMID).

17.3.1 Interrupt Request

When a level change occurs at the NMI pin after the duration longer than the minimum NMI interrupt pulse width, a non-maskable interrupt which does not depend on the master interrupt enable flag (MIE) is generated.

Figure 17-2 shows the NMI interrupt generation timing.

Figure 17-2 NMI Interrupt Generation Timing

Chapter 18

Port 0

18. Port 0

18.1 Overview

This LSI includes Port 0 (P00 to P03) which is a 4-bit input port.

18.1.1 Features

- All bits support a maskable interrupt function.
- Allows selection of interrupt disabled mode, falling-edge interrupt mode, rising-edge interrupt mode, or both-edge interrupt mode for each bit.
- Allows selection of with/without interrupt sampling for each bit.(Sampling frequency: T16KHZ)
- Allows selection of high-impedance input mode, input mode with a pull-down resistor, or input mode with a pull-up resistor for each bit.
- The P00 and P01 pins can be used as the trigger input pins of the capture circuit and the P02 pin can be used as the RXD0 input pin of UART0.

18.1.2 Configuration

Figure 18-1 shows the configuration of Port 0.

P0D : Port 0 data register
P0CON0 : Port 0 control register 0
P0CON1 : Port 0 control register 1
EXICON0 : External interrupt control register 0
EXICON1 : External interrupt control register 1
EXICON2 : External interrupt control register 2

Figure 18-1 Configuration of Port 0

18.1.3 List of Pins

Pin name	I/O	Description
P00/EXI0/CAP0	I	Input port, External 0 interrupt, Capture 0 trigger signal input
P01/EXI1/CAP1	I	Input port, External 1 interrupt, Capture 1 trigger signal input
P02/EXI2/RXD0	I	Input port, External 2 interrupt, UART0 data input (RXD0)
P03/EXI3	I	Input port, External 3 interrupt

18.2 Description of Registers

18.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F204H	Port 0 data register	P0D	—	R	8	Depends on pin status
0F206H	Port 0 control register 0	P0CON0	P0CON	R/W	8/16	00H
0F207H	Port 0 control register 1	P0CON1		R/W	8	00H
0F020H	External interrupt control register 0	EXICON0	—	R/W	8	00H
0F021H	External interrupt control register 1	EXICON1	—	R/W	8	00H
0F022H	External interrupt control register 2	EXICON2	—	R/W	8	00H

18.2.2 Port 0 Data Register (P0D)

Address: 0F204H

Access: R

Access size: 8 bits

Initial value: Depends on pin status

	7	6	5	4	3	2	1	0
P0D	—	—	—	—	P03D	P02D	P01D	P00D
R	R	R	R	R	R	R	R	R
Initial value	0	0	0	0	x	x	x	x

P0D is a special function register (SFR) to only read the pin level of Port 0.

[Description of Bits]

- **P03D-P00D** (bits 3-0)

The P03D to P00D bits are used to read the pin level of Port 0.

P00D	Description
0	P00 pin input: "L" level
1	P00 pin input: "H" level

P01D	Description
0	P01 pin input: "L" level
1	P01 pin input: "H" level

P02D	Description
0	P02 pin input: "L" level
1	P02 pin input: "H" level

P03D	Description
0	P03 pin input: "L" level
1	P03 pin input: "H" level

18.2.3 Port 0 Control Registers 0, 1 (P0CON0, P0CON1)

Address: 0F206H
Access: R/W
Access size: 8/16 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
P0CON0	—	—	—	—	P03C0	P02C0	P01C0	P00C0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

Address: 0F207H
Access: R/W
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
P0CON1	—	—	—	—	P03C1	P02C1	P01C1	P00C1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

P0CON0 and P0CON1 are special function registers (SFRs) to select the input mode of Port 0.

[Description of Bits]

- **P03C0-P00C0, P03C1-P00C1** (bits 3-0)

The P03C0 to P00C0 bits and the P03C1 to P00C1 bits are used to select high-impedance input mode, input mode with a pull-down resistor, or input mode with a pull-up resistor. The P0nC0 bit and the P0nC1 bit determine the input mode of P0n (Example: When P02C0 = “0” and P02C1 = “1”, P02 is in input mode with a pull-up resistor).

P03C1-P00C1	P03C0-P00C0	Description
0	0	High-impedance input mode (initial value)
0	1	Input mode with a pull-down resistor
1	0	Input mode with a pull-up resistor
1	1	High-impedance input mode

18.2.4 External Interrupt Control Registers 0, 1 (EXICON0, EXICON1)

Address: 0F020H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
EXICON0	—	—	—	—	P03E0	P02E0	P01E0	P00E0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

Address: 0F021H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
EXICON1	—	—	—	—	P03E1	P02E1	P01E1	P00E1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

EXICON0 and EXICON1 are special function registers (SFRs) to select an interrupt edge of Port 0.

[Description of Bits]

- **P03E0-P00E0, P03E1-P00E1** (bits 3-0)

The P03E0 to P00E0 bits and the P03E1 to P00E1 bits are used to select interrupt disabled mode, falling-edge interrupt mode, rising-edge interrupt mode, or both-edge interrupt mode. The P0nE0 bit and the P0nE1 bit determine the interrupt mode of P0n (Example: When P02E0 = "0" and P02E1 = "1", P02 is in rising-edge interrupt mode).

P03E1-P00E1	P03E0-P00E0	Description
0	0	Interrupt disabled mode (initial value)
0	1	Falling-edge interrupt mode
1	0	Rising-edge interrupt mode
1	1	Both-edge interrupt mode

18.2.5 External Interrupt Control Register 2 (EXICON2)

Address: 0F022H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
EXICON2	—	—	—	—	P03SM	P02SM	P01SM	P00SM
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

EXICON2 is a special function register (SFR) to select detection of signal edge for interrupts with or without sampling.

[Description of Bits]

- **P03SM-P00SM** (bits 3-0)

The P03SM to P00SM bits are used to select detection of signal edge for Port 0 interrupts with or without sampling. The sampling clock is T16KHZ of the low-speed time base counter (LTBC).

P00SM	Description
0	Detects the input signal edge for a P00 interrupt without sampling (initial value).
1	Detects the input signal edge for a P00 interrupt with sampling.

P01SM	Description
0	Detects the input signal edge for a P01 interrupt without sampling (initial value).
1	Detects the input signal edge for a P01 interrupt with sampling.

P02SM	Description
0	Detects the input signal edge for a P02 interrupt without sampling (initial value).
1	Detects the input signal edge for a P02 interrupt with sampling.

P03SM	Description
0	Detects the input signal edge for a P03 interrupt without sampling (initial value).
1	Detects the input signal edge for a P03 interrupt with sampling.

Note:

In STOP mode, since the 16 kHz sampling clock stops, no sampling is performed regardless of the values set in P00SM to P03SM.

18.3 Description of Operation

For each pin of Port 0, the setting of the Port 0 control registers 0 and 1 (P0CON0 and P0CON1) allows selection of high-impedance input mode, input mode with a pull-down resistor, or input mode with a pull-up resistor. High-impedance input mode is selected at system reset.

The pin level of Port 0 can be read by reading the Port 0 data register (P0D).

18.3.1 External Interrupt/Capture Function

The Port 0 pins (P00, P01, P02, P03) can be used for P00 to P03 interrupts (P00INT to P03INT). The P00 to P03 interrupts are maskable and interrupt enable or disable can be selected. For details of interrupts, see Chapter 5, "Interrupts".

The P00 and P01 pins can be used as the trigger input for the capture circuit and the P02 pin can be used as the RXD0 input pin of UART0.

For the capture function and the UART function, see Chapter 9, "Capture," and Chapter 15, "UART," respectively.

18.3.2 Interrupt Request

When an interrupt edge selected with the external interrupt control register 0, 1, or 2 (EXICON0, EXICON1, or EXICON2) occurs at a Port 0 pin, a maskable P00 (P01, P02, or P03) interrupt (P00INT, P01INT, P02INT, or P03INT). Figure 18-2 shows the P00 to P03 interrupt generation timing in rising-edge interrupt mode, in falling-edge interrupt mode, and in both-edge interrupt mode without sampling and the P00 to P03 interrupt generation timing in rising-edge interrupt mode with sampling.

(a) When Falling-Edge Interrupt Mode without Sampling is Selected

(b) When Rising-Edge Interrupt Mode without Sampling is Selected

(c) When Both-Edge Interrupt Mode without Sampling is Selected

(d) When Rising-Edge Interrupt Mode with Sampling is Selected

Figure 18-2 P00 to P03 Interrupt Generation Timing

Chapter 19

Port 1

19. Port 1

19.1 Overview

This LSI incorporates a 2-bit input port, Port 1 (P10, P11).

Port 1 can have a high-speed oscillation pin or an external clock input pin as a secondary function. When the port is used as a high-speed oscillation pin, the P11 pin functions as an output pin if crystal/ceramic oscillation mode is selected with the OSCM1–0 bits of the FCON0 register.

For high-speed oscillation and external clock input, see Chapter 6, “Clock Generation Circuit”.

19.1.1 Features

- Allows selection of high-impedance input mode, input mode with a pull-down resistor, or input mode with a pull-up resistor for each bit.
- Allows selection of a high-speed crystal/ceramic resonator pin or an external clock input pin as a secondary function.

19.1.2 Configuration

Figure 19-1 shows the configuration of Port 1.

Figure 19-1 Configuration of Port 1

19.1.3 List of Pins

Pin name	I/O	Primary function	Secondary function
P10/OSC0	I	Input port	High-speed crystal/ceramic oscillation pin, external clock input pin
P11/OSC1	I/O	Input port	High-speed crystal/ceramic oscillation pin

19.2 Description of Registers

19.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F208H	Port 1 data register	P1D	—	R	8	Depends on pin status
0F20AH	Port 1 control register 0	P1CON0	P1CON	R/W	8/16	00H
0F20BH	Port 1 control register 1	P1CON1		R/W	8	00H

19.2.2 Port 1 Data Register (P1D)

Address: 0F208H

Access: R

Access size: 8 bits

Initial value: Depends on pin status

	7	6	5	4	3	2	1	0
P1D	—	—	—	—	—	—	P11D	P10D
R	R	R	R	R	R	R	R	R
Initial value	0	0	0	0	0	0	x	x

P1D is a special function register (SFR) dedicated to read the input level of the Port 1 pin.

[Description of Bits]

- **P11D, P10D** (bits 1, 0)

The P11D and P10D bits are used to read the input level of the Port 1 pin.

P11D	Description
0	Input level of the P11 pin: "L"
1	Input level of the P11 pin: "H"

P10D	Description
0	Input level of the P10 pin: "L"
1	Input level of the P10 pin: "H"

19.2.3 Port 1 Control Registers 0, 1 (P1CON0, P1CON1)

Address: 0F20AH

Access: R/W

Access size: 8/16 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
P1CON0	—	—	—	—	—	—	P11C0	P10C0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

Address: 0F20BH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
P0CON1	—	—	—	—	—	—	P11C1	P10C1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

P1CON0 and P1CON1 are special function registers (SFRs) to select the input mode of Port 1.

[Description of Bits]

- **P11C0, P10C0, P11C1, P00C1** (bits 1-0)

The P11C0, P10C0, P11C1 and P00C1 bits are used to select high-impedance input mode, input mode with a pull-down resistor, or input mode with a pull-up resistor.

P11C1	P11C0	Description
0	0	P11 pin: high-impedance input mode (initial value)
0	1	P11 pin: input mode with a pull-down resistor
1	0	P11 pin: input mode with a pull-up resistor
1	1	P11 pin: high-impedance input mode

P10C1	P10C0	Description
0	0	P10 pin: high-impedance input mode (initial value)
0	1	P10 pin: input mode with a pull-down resistor
1	0	P10 pin: input mode with a pull-up resistor
1	1	P10 pin: high-impedance input mode

Note:

When using P10 and P11 as crystal/ceramic oscillation pins, be sure to set the P10 and P11 pins to high-impedance input mode.

When using the P10 pin as an external clock input pin, set the P10 pin to high-impedance input mode so that the pull-up or pull-down resistor will not carry current.

19.3 Description of Operation

19.3.1 Input Port Function

For each pin of Port 1, one of high-impedance input mode, input mode with a pull-down resistor, and input mode with a pull-up resistor can be selected by setting the Port 1 control registers 0 and 1 (P1CON0 and P1CON1). At system reset, high-impedance input mode is selected as the initial state.

The input level of the Port 1 pin can be read by reading the Port 1 data register (P1D).

19.3.2 Secondary Function

A high-speed crystal/ceramic oscillation pin or an external clock input pin is assigned to Port 1 as a secondary function. Select high-speed crystal/ceramic oscillation mode or external clock input mode by using the high-speed clock mode select function of the OSCM1 and 0 bits of the frequency control register 0 (FCON0). In crystal/ceramic oscillation mode, both P10 and P11 pins are used as the pins for crystal/ceramic oscillation.

In external clock input mode, the P10 pin is used as the input pin of external clock and the P11 pin can be used as a general-purpose input port.

Note:

No port mode register is provided for switching between the primary function and the secondary function of Port 1. When using the Port 1 pins as high-speed oscillation pins, pin mode is switched according to the values set in the OSCM1 and OSCM0 bits of the FCON0 register.

See Chapter 6, "Clock Generation Circuit," for the details of the FCON0 register, high-speed oscillation, and external clock input.

Chapter 20

Port 2

20. Port 2

20.1 Overview

This LSI includes 3-bit Port 2 (P20 to P22) dedicated to output.

Port 2 can output low-speed clock (LSCLK), high-speed output clock (OUTCLK), and melody as a secondary function. For clock output and melody 0 (MD0) output, see Chapter 6, "Clock Generation Circuit" and Chapter 24, "Melody Driver", respectively.

20.1.1 Features

- Allows direct LED drive.
- Allows selection of high-impedance output mode, P-channel open drain output mode, N-channel open drain output mode, or CMOS output mode for each bit.
- Allows output of low-speed clock (LSCLK), high-speed clock (OUTCLK), or melody 0 (MD0) as a secondary function.

20.1.2 Configuration

Figure 20-1 shows the configuration of Port 2.

Figure 20-1 Configuration of Port 2

20.1.3 List of Pins

Pin name	I/O	Primary function	Secondary function
P20/LED0/LSCLK	O	Output port, Direct LED drive	Low-speed clock output (LSCLK)
P21/LED1/OUTCLK	O	Output port, Direct LED drive	High-speed clock output (OUTCLK)
P22/LED2/MD0	O	Output port, Direct LED drive	Melody 0 output (MD0)

20.2 Description of Registers

20.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F210H	Port 2 data register	P2D	—	R/W	8	00H
0F212H	Port 2 control register 0	P2CON0	P2CON	R/W	8/16	00H
0F213H	Port 2 control register 1	P2CON1		R/W	8	00H
0F214H	Port 2 mode register	P2MOD	—	R/W	8	00H

20.2.2 Port 2 Data Register (P2D)

Address: 0F210H
Access: R/W
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
P2D	—	—	—	—	—	P22D	P21D	P20D
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

P2D is a special function register (SFR) to set the output value of Port 2. The value of this register is output to Port 2. The value written to P2D is readable.

[Description of Bits]

- **P22D-P20D** (bits 2-0)

The P22D to P20D bits are used to set the output value of the Port 2 pin.

P22D	Description
0	Output level of the P22 pin: "L"
1	Output level of the P22 pin: "H"

P21D	Description
0	Output level of the P21 pin: "L"
1	Output level of the P21 pin: "H"

P20D	Description
0	Output level of the P20 pin: "L"
1	Output level of the P20 pin: "H"

20.2.3 Port 2 control registers 0, 1 (P2CON0, P2CON1)

Address: 0F212H

Access: R/W

Access size: 8/16 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
P2CON0	—	—	—	—	—	P22C0	P21C0	P20C0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

Address: 0F213H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
P2CON1	—	—	—	—	—	P22C1	P21C1	P20C1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

P2CON0 and P2CON1 are special function registers (SFRs) to select the output state of the output pin Port 2.

[Description of Bits]

- **P22C0-P20C0, P22C1-P20C1 (bits 3-0)**

The P22C0 to P20C0 and P22C1 to P20C1 bits are used to select high-impedance output mode, P-channel open drain output mode, N-channel open drain output mode, or CMOS output mode.

To directly drive LEDs, select N-channel open drain output mode.

P22C1	P22C0	Description
0	0	P22 pin: In high-impedance output mode (initial value)
0	1	P22 pin: In P-channel open drain output mode
1	0	P22 pin: In N-channel open drain output mode
1	1	P22 pin: In CMOS output mode

P21C1	P21C0	Description
0	0	P21 pin: In high-impedance output mode (initial value)
0	1	P21 pin: In P-channel open drain output mode
1	0	P21 pin: In N-channel open drain output mode
1	1	P21 pin: In CMOS output mode

P20C1	P20C0	Description
0	0	P20 pin: In high-impedance output mode (initial value)
0	1	P20 pin: In P-channel open drain output mode
1	0	P20 pin: In N-channel open drain output mode
1	1	P20 pin: In CMOS output mode

20.2.4 Port 2 Mode Register (P2MOD)

Address: 0F214H
Access: R/W
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
P2MOD	—	—	—	—	—	P22MD	P21MD	P20MD
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

P2MOD is a special function register (SFR) to select the primary function or the secondary function of Port 2

[Description of Bits]

- **P22MD** (bit 2)

The P22MD bit is used to select the primary function or the secondary function of the P22 pin.

P22MD	Description
0	General-purpose output port function (initial value)
1	Melody 0 (MD0) output function

- **P21MD** (bit 1)

The P21MD bit is used to select the primary function or the secondary function of the P21 pin.

P21MD	Description
0	General-purpose output port function (initial value)
1	High-speed output clock (OUTCLK) output function

- **P20MD** (bit 0)

The P20MD bit is used to select the primary function or the secondary function of the P20 pin.

P20MD	Description
0	General-purpose output port function (initial value)
1	Low-speed clock (LSCLK) output function

Note:

The output characteristics of port2(P20, P21 and P22) corresponds to VOL1 and VOH1 when each bit (P20MD, P21MD, P22MD) is "1", and corresponds to VOL2 and VOH2 when the bit is "0", which are shown in Appendix C, "Electrical Characteristics".

20.3 Description of Operation

20.3.1 Output Port Function

For each pin of Port 2, any one of high-impedance output mode, P-channel open drain output mode, N-channel open drain output mode, and CMOS output mode can be selected by setting the Port 2 control registers 0 and 1 (P2CON0 and P2CON1). At a system reset, high-impedance output mode is selected as the initial state. Depending of the value set in the Port 2 data register (P2D), a “L” level or “H” level signal is output to each pin of Port 2.

20.3.2 Secondary Function

Low-speed clock (LSCLK) output, High-speed output clock (OUTCLK) output, or melody 0 (MD0) output is assigned to Port 2 as a secondary function. The secondary function can be used by setting the P22MD to P20MD bits of the Port 2 mode register (P2MOD) to “1”.

Chapter 21

Port 3

21. Port 3

21.1 Overview

This LSI includes Port 3 (P30 to P35), which is a 6-bit input/output port.

This port can also be used as the RC-ADC (channel 0) oscillation pins (IN0, CS0, RS0, RT0, RCT0, RCM) and the PWM output pin in secondary and tertiary modes.

For RC-ADC and PWM, see Chapter 25, “RC Oscillation Type A/D converter”, and Chapter 12, “PWM”.

21.1.1 Features

- Allows selection of high-impedance output, P-channel open drain output, N-channel open drain output, or CMOS output in output mode for each bit.
- Allows selection of high-impedance input, input with a pull-down resistor, or input with a pull-up resistor in input mode for each bit.
- The RC-ADC (channel 0) oscillation pins (IN0, CS0, RS0, RT0, RCT0, RCM) and the PWM output pin (PWM0) can be used as the secondary functions.

21.1.2 Configuration

Figure 21-1 shows the configuration of Port 3.

Figure 21-1 Configuration of Port 3

21.1.3 List of Pins

Pin name	I/O	Primary function	Secondary function	Tertiary function
P30/IN0	I/O	Input/output port	Oscillation waveform input pin for RC-ADC	—
P31/CS0	I/O	Input/output port	Reference capacitor connection pin for RC-ADC	—
P32/RS0	I/O	Input/output port	Reference resistor connection pin for RC-ADC	—
P33/RT0	I/O	Input/output port	Resistor sensor connection pin for measurement for RC-ADC	—
P34/RCT0/PWM0	I/O	Input/output port	Resistor/capacitor sensor connection pin for measurement for RC-ADC	PWM0 output pin
P35/RCM	I/O	Input/output port	RC oscillation monitor pin for RC-ADC	—

21.2 Description of Registers

21.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F218H	Port 3 data register	P3D	—	R/W	8	00H
0F219H	Port 3 direction register	P3DIR	—	R/W	8	00H
0F21AH	Port 3 control register 0	P3CON0	P3CON	R/W	8/16	00H
0F21BH	Port 3 control register 1	P3CON1		R/W	8	00H
0F21CH	Port 3 mode register 0	P3MOD0	P3MOD	R/W	8/16	00H
0F21DH	Port 3 mode register 1	P3MOD1		R/W	8	00H

21.2.2 Port 3 data register (P3D)

Address: 0F218H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
P3D	—	—	P35D	P34D	P33D	P32D	P31D	P30D
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

P3D is a special function register (SFR) to set the value to be output to the Port 3 pin or to read the input level of the Port 3. In output mode, the value of this register is output to the Port 3 pin. The value written to P3D is readable. In input mode, the input level of the Port 3 pin is read when P3D is read. Output mode or input mode is selected by using the port 3 direction register (P3DIR) described later.

[Description of Bits]

- **P35D-P30D** (bits 5-0)

The P35D to P30D bits are used to set the output value of the Port 3 pin in output mode and to read the pin level of the Port 3 pin in input mode.

P35D	Description
0	Output or input level of the P35 pin: "L"
1	Output or input level of the P35 pin: "H"

P34D	Description
0	Output or input level of the P34 pin: "L"
1	Output or input level of the P34 pin: "H"

P33D	Description
0	Output or input level of the P33 pin: "L"
1	Output or input level of the P33 pin: "H"

P32D	Description
0	Output or input level of the P32 pin: "L"
1	Output or input level of the P32 pin: "H"

P31D	Description
0	Output or input level of the P31 pin: "L"
1	Output or input level of the P31 pin: "H"

P30D	Description
0	Output or input level of the P30 pin: "L"
1	Output or input level of the P30 pin: "H"

21.2.3 Port 3 Direction Register (P3DIR)

Address: 0F219H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
P3DIR	—	—	P35DIR	P34DIR	P33DIR	P32DIR	P31DIR	P30DIR
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

P3DIR is a special function register (SFR) to select the input/output mode of Port 3.

[Description of Bits]

- **P35DIR-P30DIR** (bits 5-0)

The P35DIR to P30DIR pins are used to set the input/output direction of the Port 3 pin.

P35DIR	Description
0	P35 pin: Output (initial value)
1	P35 pin: Input

P34DIR	Description
0	P34 pin: Output (initial value)
1	P34 pin: Input

P33DIR	Description
0	P33 pin: Output (initial value)
1	P33 pin: Input

P32DIR	Description
0	P32 pin: Output (initial value)
1	P32 pin: Input

P31DIR	Description
0	P31 pin: Output (initial value)
1	P31 pin: Input

P30DIR	Description
0	P30 pin: Output (initial value)
1	P30 pin: Input

21.2.4 Port 3 control registers 0, 1 (P3CON0, P3CON1)

Address: 0F21AH

Access: R/W

Access size: 8/16 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
P3CON0	—	—	P35C0	P34C0	P33C0	P32C0	P31C0	P30C0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

Address: 0F21BH

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
P3CON1	—	—	P35C1	P34C1	P33C1	P32C1	P31C1	P30C1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

P3CON0 and P3CON1 are special function registers (SFRs) to select input/output state of the Port 3 pin. The input/output state is different between input mode and output mode. Input or output is selected by using the P3DIR register.

[Description of Bits]

- **P35C1-P30C1, P35C0-P30C0** (bits 5-0)

The P35C1 to P30C1 pins and the P35C0 to P30C0 pins are used to select high-impedance output, P-channel open drain output, N-channel open drain output, or CMOS output in output mode and to select high-impedance input, input with a pull-down resistor, or input with a pull-up resistor in input mode.

		When output mode is selected (P35DIR bit = "0")	When input mode is selected (P35DIR bit = "1")
P35C1	P35C0	Description	
0	0	P35 pin: High-impedance output (initial value)	P35 pin: High-impedance input
0	1	P35 pin: P-channel open drain output	P35 pin: Input with a pull-down resistor
1	0	P35 pin: N-channel open drain output	P35 pin: Input with a pull-up resistor
1	1	P35 pin: CMOS output	P35 pin: High-impedance input

		When output mode is selected (P34DIR bit = "0")	When input mode is selected (P34DIR bit = "1")
P34C1	P34C0	Description	
0	0	P34 pin: High-impedance output (initial value)	P34 pin: High-impedance input
0	1	P34 pin: P-channel open drain output	P34 pin: Input with a pull-down resistor
1	0	P34 pin: N-channel open drain output	P34 pin: Input with a pull-up resistor
1	1	P34 pin: CMOS output	P34 pin: High-impedance input

		When output mode is selected (P33DIR bit = "0")	When input mode is selected (P33DIR bit = "1")
P33C1	P33C0	Description	
0	0	P33 pin: High-impedance output (initial value)	P33 pin: High-impedance input
0	1	P33 pin: P-channel open drain output	P33 pin: Input with a pull-down resistor
1	0	P33 pin: N-channel open drain output	P33 pin: Input with a pull-up resistor
1	1	P33 pin: CMOS output	P33 pin: High-impedance input

		When output mode is selected (P32DIR bit = "0")	When input mode is selected (P32DIR bit = "1")
P32C1	P32C0	Description	
0	0	P32 pin: High-impedance output (initial value)	P32 pin: High-impedance input
0	1	P32 pin: P-channel open drain output	P32 pin: Input with a pull-down resistor
1	0	P32 pin: N-channel open drain output	P32 pin: Input with a pull-up resistor
1	1	P32 pin: CMOS output	P32 pin: High-impedance input

		When output mode is selected (P31DIR bit = "0")	When input mode is selected (P31DIR bit = "1")
P31C1	P31C0	Description	
0	0	P31 pin: High-impedance output (initial value)	P31 pin: High-impedance input
0	1	P31 pin: P-channel open drain output	P31 pin: Input with a pull-down resistor
1	0	P31 pin: N-channel open drain output	P31 pin: Input with a pull-up resistor
1	1	P31 pin: CMOS output	P31 pin: High-impedance input

		When output mode is selected (P30DIR bit = "0")	When input mode is selected (P30DIR bit = "1")
P30C1	P30C0	Description	
0	0	P30 pin: High-impedance output (initial value)	P30 pin: High-impedance input
0	1	P30 pin: P-channel open drain output	P30 pin: Input with a pull-down resistor
1	0	P30 pin: N-channel open drain output	P30 pin: Input with a pull-up resistor
1	1	P30 pin: CMOS output	P30 pin: High-impedance input

21.2.5 Port 3 mode registers 0, 1 (P3MOD0, P3MOD1)

Address: 0F21CH
Access: R/W
Access size: 8/16 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
P3MOD0	—	—	P35MD0	P34MD0	P33MD0	P32MD0	P31MD0	P30MD0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

Address: 0F21DH
Access: R/W
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
P3MOD1	—	—	P35MD1	P34MD1	P33MD1	P32MD1	P31MD1	P30MD1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

P3MOD0 and P3MOD1 are special function registers (SFRs) to select the primary, secondary, or tertiary function of Port 3.

[Description of Bits]

- **P35MD1, P35MD0** (bit 5)

The P35MD1 and P35MD0 bits are used to select the primary or secondary function of the P35 pin.

P35MD1	P35MD0	Description
0	0	General-purpose input/output mode (initial value)
0	1	RC oscillation monitor pin for RC-ADC
1	0	Prohibited
1	1	Prohibited

- **P34MD1, P34MD0** (bit 4)

The P34MD1 and P34MD0 bits are used to select the primary, secondary, or tertiary function of the P34 pin.

P34MD1	P34MD0	Description
0	0	General-purpose input/output mode (initial value)
0	1	Resistor/capacitor sensor connection pin for measurement for RC-ADC (channel 0)
1	0	PWM0 output pin
1	1	Prohibited

- **P33MD1, P33MD0** (bit 3)

The P33MD1 and P33MD0 bits are used to select the primary or secondary function of the P33 pin.

P33MD1	P33MD0	Description
0	0	General-purpose input/output mode (initial value)
0	1	Resistor/capacitor sensor connection pin for measurement for RC-ADC (channel 0)
1	0	Prohibited
1	1	Prohibited

- **P32MD1, P32MD0** (bit 2)

The P32MD1 and P32MD0 bits are used to select the primary or secondary function of the P32 pin.

P32MD1	P32MD0	Description
0	0	General-purpose input/output mode (initial value)
0	1	Reference resistor connection pin for RC-ADC (channel 0)
1	0	Prohibited
1	1	Prohibited

- **P31MD1, P31MD0** (bit 1)

The P31MD1 and P31MD0 bits are used to select the primary or secondary function of the P31 pin.

P31MD1	P31MD0	Description
0	0	General-purpose input/output mode (initial value)
0	1	Reference capacitor connection pin for RC-ADC (channel 0)
1	0	Prohibited
1	1	Prohibited

- **P30MD1, P30MD0** (bit 0)

The P30MD1 and P30MD0 bits are used to select the primary or secondary function of the P30 pin.

P30MD1	P30MD0	Description
0	0	General-purpose input/output mode (initial value)
0	1	RC oscillation waveform input pin for RC-ADC (channel 0)
1	0	Prohibited
1	1	Prohibited

Note:

If any bit combination out of the above is set to “Prohibited” and the corresponding bit of the port 3 is specified to output mode (selected in port3 control register), status of corresponding pin is fixed, regardless the contents of Port3 register (P3D)

High-impedance output mode: High-impedance

P-channel open drain output mode: High-impedance

N-channel open drain output mode: Fixed to “L”

CMOS output mode: High-impedance: Fixed to “L”

When using RC-ADC as the secondary function, specify each pin be “High-impedance input” even the RC oscillation monitor pin. Pull-up or Pull-down input makes drawing the current.

21.3 Description of Operation

21.3.1 Input/Output Port Functions

For each pin of Port 3, either output or input is selected by setting the Port 3 direction register (P3DIR).

In output mode, high-impedance output mode, P-channel open drain output mode, N-channel open drain output mode, or CMOS output mode can be selected by setting the Port 3 control registers 0 and 1 (P3CON0 and P3CON1).

In input mode, high-impedance input mode, input mode with a pull-down resistor, or input mode with a pull-up resistor can be selected by setting the Port 3 control registers 0 and 1 (P3CON0 and P3CON1).

At a system reset, high-impedance output mode is selected as the initial state.

In output mode, "L" or "H" level is output to each pin of Port 3 depending on the value set by the Port 3 data register (P3D).

In input mode, the input level of each pin of Port 3 can be read from the Port 3 data register (P3D).

21.3.2 Secondary and Tertiary Functions

Secondary and tertiary functions are assigned to Port 3 as the RC-ADC (channel 0) oscillation pins (IN0, CS0, RS0, RT0, RCT0, RCM) and the PWM output pin (PWM0). These pins can be used in a secondary or tertiary function mode by setting the P35MD0 to P30MD0 bits and the P35MD1 to P30MD1 bits of the Port 3 mode registers (P3MOD0, P3MOD1).

Note:

All the port 3 pins except P35/RCM are configured as pins dedicated to the RC-ADC function during A/D conversion. Therefore, if there is any unused pin, that pin cannot be used as its primary function during A/D conversion. For the RC-ADC, see Chapter 25, "RC Oscillation Type A/D Converter".

Chapter 22

Port 4

22. Port 4

22.1 Overview

This LSI includes Port 4 (P40 to P47) which is an 8-bit input/output port.

This port can have the I2C bus, RC-ADC, synchronous serial port, and PWM output functions as secondary and tertiary functions.

See the following chapters for reference:

I2C bus:	Chapter 16 “I2C Bus Interface”
UART:	Chapter 15 “UART”
RC-ADC:	Chapter 25 “RC Oscillation Type A/D Converter”
Synchronous serial port:	Chapter 14 “Synchronous Serial Port”
PWM:	Chapter 12 “PWM”

22.1.1 Features

- Allows selection of high-impedance output, P-channel open drain output, N-channel open drain output, or CMOS output for each bit in output mode.
- Allows selection of high-impedance input, input with a pull-down resistor, or input with a pull-up resistor for each bit in input mode.
- The P44 and P45 pins can be used as external clock input pins for the timer and PWM.
- The I2C bus interface pins (SDA, SCL), UART pins (RXD0, TXD0), RC-ADC (channel 1) oscillation pins (IN1, CS1, RS1, RT1), synchronous serial port pins (SIN0, SCK0, SOUT0), and PWM output pin (PWM0) can be used as the secondary functions.

22.1.2 Configuration

Figure 22-1 shows the configuration of Port 4.

Figure 22-1 Configuration of Port 4

22.1.3 List of Pins

Pin name	I/O	Primary function	Secondary function	Tertiary function
P40/SDA/SIN0	I/O	Input/output port	I ² C bus 0 data input/output pin	SSIO0 data input pin
P41/SCL/SCK0	I/O	Input/output port	I ² C bus 0 clock input/output pin	SSIO0 clock input/output pin
P42/RXD0/SOUT0	I/O	Input/output port	UART0 data input pin	SSIO0 data output pin
P43/TXD0/PWM0	I/O	Input/output port	UART0 data output pin	PWM0 output pin
P44/ T02P0CK /IN1/SIN0/	I/O	Input/output port, Timer 0/Timer 2/ PWM0 external clock	RC oscillation waveform input pin for RC-ADC	SSIO0 data input pin

22.2.2 Port 4 Data Register (P4D)

Address: 0F220H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
P4D	P47D	P46D	P45D	P44D	P43D	P42D	P41D	P40D
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

P4D is a special function register (SFR) to set the value to be output to the Port 4 pin or to read the input level of the Port 4. In output mode, the value of this register is output to the Port 4 pin. The value written to P4D is readable. In input mode, the input level of the Port 4 pin is read when P4D is read. Output mode or input mode is selected by using the port 4 direction register (P4DIR) described later.

[Description of Bits]

- **P47D-P40D** (bits 7-0)

The P47D to P40D bits are used to set the output value of the Port 4 pin in output mode and to read the pin level of the Port 4 pin in input mode.

P47D	Description
0	Output or input level of the P47 pin: "L"
1	Output or input level of the P47 pin: "H"

P46D	Description
0	Output or input level of the P46 pin: "L"
1	Output or input level of the P46 pin: "H"

P45D	Description
0	Output or input level of the P45 pin: "L"
1	Output or input level of the P45 pin: "H"

P44D	Description
0	Output or input level of the P44 pin: "L"
1	Output or input level of the P44 pin: "H"

P43D	Description
0	Output or input level of the P43 pin: "L"
1	Output or input level of the P43 pin: "H"

P42D	Description
0	Output or input level of the P42 pin: "L"
1	Output or input level of the P42 pin: "H"

P41D	Description
0	Output or input level of the P41 pin: "L"
1	Output or input level of the P41 pin: "H"

P40D	Description
0	Output or input level of the P40 pin: "L"
1	Output or input level of the P40 pin: "H"

22.2.3 Port 4 Direction Register (P4DIR)

Address: 0F221H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
P4DIR	P47DIR	P46DIR	P45DIR	P44DIR	P43DIR	P42DIR	P41DIR	P40DIR
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

P4DIR is a special function register (SFR) to select the input/output mode of Port 4.

[Description of Bits]

- **P47DIR-P40DIR** (bits 7-0)

The P47DIR to P40DIR pins are used to set the input/output direction of the Port 4 pin.

P47DIR	Description
0	P47 pin: Output (initial value)
1	P47 pin: Input

P46DIR	Description
0	P46 pin: Output (initial value)
1	P46 pin: Input

P45DIR	Description
0	P45 pin: Output (initial value)
1	P45 pin: Input

P44DIR	Description
0	P44 pin: Output (initial value)
1	P44 pin: Input

P43DIR	Description
0	P43 pin: Output (initial value)
1	P43 pin: Input

P42DIR	Description
0	P42 pin: Output (initial value)
1	P42 pin: Input

P41DIR	Description
0	P41 pin: Output (initial value)
1	P41 pin: Input

P40DIR	Description
0	P40 pin: Output (initial value)
1	P40 pin: Input

22.2.4 Port 4 Control Registers 0, 1 (P4CON0, P4CON1)

Address: 0F222H

Access: R/W

Access size: 8/16 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
P4CON0	P47C0	P46C0	P45C0	P44C0	P43C0	P42C0	P41C0	P40C0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

Address: 0F223H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
P4CON1	P47C1	P46C1	P45C1	P44C1	P43C1	P42C1	P41C1	P40C1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

P4CON0 and P4CON1 are special function registers (SFRs) to select input/output state of the Port 4 pin. The input/output state is different between input mode and output mode. Input or output is selected by using the P4DIR register.

[Description of Bits]

- **P47C1-P40C1, P47C0-P40C0** (bits 7-0)

The P47C1 to P40C1 pins and the P47C0 to P40C0 pins are used to select high-impedance output, P-channel open drain output, N-channel open drain output, or CMOS output in output mode and to select high-impedance input, input with a pull-down resistor, or input with a pull-up resistor in input mode.

Setting of P47 pin		When output mode is selected (P47DIR bit = "0")	When input mode is selected (P47DIR bit = "1")
P47C1	P47C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

Setting of P46 pin		When output mode is selected (P46DIR bit = "0")	When input mode is selected (P46DIR bit = "1")
P46C1	P46C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

Setting of P45 pin		When output mode is selected (P45DIR bit = "0")	When input mode is selected (P45DIR bit = "1")
P45C1	P45C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

Setting of P44 pin		When output mode is selected (P44DIR bit = "0")	When input mode is selected (P44DIR bit = "1")
P44C1	P44C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

Setting of P43 pin		When output mode is selected (P43DIR bit = "0")	When input mode is selected (P43DIR bit = "1")
P43C1	P43C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

Setting of P42 pin		When output mode is selected (P42DIR bit = "0")	When input mode is selected (P42DIR bit = "1")
P42C1	P42C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

Setting of P41 pin		When output mode is selected (P41DIR bit = "0")	When input mode is selected (P41DIR bit = "1")
P41C1	P41C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

Setting of P40 pin		When output mode is selected (P40DIR bit = "0")	When input mode is selected (P40DIR bit = "1")
P40C1	P40C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

22.2.5 Port 4 Mode Registers 0, 1 (P4MOD0, P4MOD1)

Address: 0F224H

Access: R/W

Access size: 8/16 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
P4MOD0	P47MD0	P46MD0	P45MD0	P44MD0	P43MD0	P42MD0	P41MD0	P40MD0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

Address: 0F225H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
P4MOD1	P47MD1	P47MD1	P45MD1	P44MD1	P43MD1	P42MD1	P41MD1	P40MD1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

P4MOD0 and P4MOD1 are special function registers (SFRs) to select the primary, secondary, or tertiary function of Port 4.

[Description of Bits]

- **P47MD1, P47MD0** (bit 7)

The P47MD1 and P47MD0 bits are used to select the primary or secondary function of the P47 pin.

P47MD1	P47MD0	Description
0	0	General-purpose input/output mode (initial value)
0	1	Resistor sensor connection pin for measurement for RC-ADC (channel 1)
1	0	Prohibited
1	1	Prohibited

- **P46MD1, P46MD0** (bit 6)

The P46MD1 and P46MD0 bits are used to select the primary, secondary, or tertiary function of the P46 pin.

P46MD1	P46MD0	Description
0	0	General-purpose input/output mode (initial value)
0	1	Reference resistor connection pin for RC-ADC (channel 1)
1	0	SIO0 data output pin
1	1	Prohibited

- **P45MD1, P45MD0** (bit 5)

The P45MD1 and P45MD0 bits are used to select the primary, secondary, or tertiary function of the P45 pin.

P45MD1	P45MD0	Description
0	0	General-purpose input/output mode (initial value)
0	1	Reference capacitor connection pin for RC-ADC (channel 1)
1	0	SIO0 clock input/output pin
1	1	Prohibited

- **P44MD1, P44MD0** (bit 4)

The P44MD1 and P44MD0 bits are used to select the primary, secondary, or tertiary function of the P44 pin.

P44MD1	P44MD0	Description
0	0	General-purpose input/output mode (initial value)
0	1	RC oscillation waveform input pin for RC-AD (channel 1)
1	0	SIO0 data input pin
1	1	Prohibited

- **P43MD1, P43MD0** (bit 3)

The P43MD1 and P43MD0 bits are used to select the primary, secondary, or tertiary function of the P43 pin.

P43MD1	P43MD0	Description
0	0	General-purpose input/output mode (initial value)
0	1	UART0 data output pin
1	0	PWM0 output pin
1	1	Prohibited

- **P42MD1, P42MD0** (bit 2)

The P42MD1 and P42MD0 bits are used to select the primary, secondary, or tertiary function of the P42 pin.

P42MD1	P42MD0	Description
0	0	General-purpose input/output mode (initial value)
0	1	UART0 input pin
1	0	SIO0 data output pin
1	1	Prohibited

- **P41MD1, P41MD0** (bit 1)

The P41MD1 and P41MD0 bits are used to select the primary, secondary, or tertiary function of the P41 pin.

P41MD1	P41MD0	Description
0	0	General-purpose input/output mode (initial value)
0	1	I ² C bus 0 clock input/output pin
1	0	SIO0 clock input/output pin
1	1	Prohibited

- **P40MD1, P40MD0** (bit 0)

The P40MD1 and P40MD0 bits are used to select the primary, secondary, or tertiary function of the P40 pin.

P40MD1	P40MD0	Description
0	0	General-purpose input/output mode (initial value)
0	1	I ² C bus 0 data input/output pin
1	0	SIO0 data input pin
1	1	Prohibited

Note:

If any bit combination out of the above is set to “Prohibited” and the corresponding bit of the port 4 is specified to output mode (selected in port4 control register), status of corresponding pin is fixed, regardless the contents of Port4 register (P4D)

High-impedance output mode: High-impedance

P-channel open drain output mode: High-impedance

N-channel open drain output mode: Fixed to “L”

CMOS output mode: High-impedance: Fixed to “L”

When using RC-ADC as the secondary function, specify each pin be “High-impedance input” even the RC oscillation monitor pin. Pull-up or Pull-down input makes drawing the current.

22.3 Description of Operation

22.3.1 Input/Output Port Functions

For each pin of Port 4, either output or input is selected by setting the Port 4 direction register (P4DIR).

In output mode, high-impedance output mode, P-channel open drain output mode, N-channel open drain output mode, or CMOS output mode can be selected by setting the Port 4 control registers 0 and 1 (P4CON0 and P4CON1).

In input mode, high-impedance input mode, input mode with a pull-down resistor, or input mode with a pull-up resistor can be selected by setting the Port 4 control registers 0 and 1 (P4CON0 and P4CON1).

At a system reset, high-impedance output mode is selected as the initial state.

In output mode, “L” or “H” level is output to each pin of Port 4 depending on the value set by the Port 4 data register (P4D).

In input mode, the input level of each pin of Port 4 can be read from the Port 4 data register (P4D).

22.3.2 Secondary and Tertiary Functions

Secondary and tertiary functions are assigned to Port 4 as the I2C bus 0 pins (SDA, SCL), UART 0 pins (RXD0, TXD0), RC-ADC (channel 1) oscillation pins (IN1, CS1, RS1, RT1), synchronous serial port 0 pins (SIN0, SCK0, SOUT), and the PWM output pin (PWM0). These pins can be used in a secondary or tertiary function mode by setting the P47MD0 to P40MD0 bits and the P47MD1 to P40MD1 bits of the Port 4 mode registers (P4MOD0, P4MOD1).

Note:

The P44 to P47 pins of port 4 are configured as pins dedicated to the RC-ADC function during A/D conversion. Therefore, if there is any unused pin, that pin cannot be used during A/D conversion. For the RC-ADC, see Chapter 25, “RC Oscillation Type A/D Converter”.

Chapter 23

Port A

23. Port A

23.1 Overview

This LSI (ML610Q431 only) includes Port A (PA0 to PA7) which is an 8-bit input/output port. This function is not included in the ML610Q432.

23.1.1 Features

- Allows selection of high-impedance output, P-channel open drain output, N-channel open drain output, or CMOS output for each bit in output mode.
- Allows selection of high-impedance input, input with a pull-down resistor, or input with a pull-up resistor for each bit in input mode.

23.1.2 Configuration

Figure 23-1 shows the configuration of Port A.

Figure 23-1 Configuration of Port A

23.1.3 List of Pins

Pin name	I/O	Description
PA0	I/O	Input/output port
PA1	I/O	Input/output port
PA2	I/O	Input/output port
PA3	I/O	Input/output port
PA4	I/O	Input/output port
PA5	I/O	Input/output port
PA6	I/O	Input/output port
PA7	I/O	Input/output port

23.2 Description of Registers

23.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F250H	Port A data register	PAD	—	R/W	8	00H
0F251H	Port A direction register	PADIR	—	R/W	8	00H
0F252H	Port A control register 0	PACON0	PACON	R/W	8/16	00H
0F253H	Port A control register 1	PACON1		R/W	8	00H

23.2.2 Port A Data Register (PAD)

Address: 0F250H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
PAD	PA7D	PA6D	PA5D	PA4D	PA3D	PA2D	PA1D	PA0D
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

PAD is a special function register (SFR) to set the value to be output to the Port A pin or to read the input level of the Port A. In output mode, the value of this register is output to the Port A pin. The value written to PAD is readable. In input mode, the input level of the Port A pin is read when PAD is read. Output mode or input mode is selected by using the port A direction register (PADIR) described later.

[Description of Bits]

- **PA7D-PA0D** (bits 7-0)

The PA7D to PA0D bits are used to set the output value of the Port A pin in output mode and to read the pin level of the Port A pin in input mode.

PA7D	Description
0	Output or input level of the PA7 pin: "L"
1	Output or input level of the PA7 pin: "H"

PA6D	Description
0	Output or input level of the PA6 pin: "L"
1	Output or input level of the PA6 pin: "H"

PA5D	Description
0	Output or input level of the PA5 pin: "L"
1	Output or input level of the PA5 pin: "H"

PA4D	Description
0	Output or input level of the PA4 pin: "L"
1	Output or input level of the PA4 pin: "H"

PA3D	Description
0	Output or input level of the PA3 pin: "L"
1	Output or input level of the PA3 pin: "H"

PA2D	Description
0	Output or input level of the PA2 pin: "L"
1	Output or input level of the PA2 pin: "H"

PA1D	Description
0	Output or input level of the PA1 pin: "L"
1	Output or input level of the PA1 pin: "H"

PA0D	Description
0	Output or input level of the PA0 pin: "L"
1	Output or input level of the PA0 pin: "H"

23.2.3 Port A Direction Register (PADIR)

Address: 0F251H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
PADIR	PA7DIR	PA6DIR	PA5DIR	PA4DIR	PA3DIR	PA2DIR	PA1DIR	PA0DIR
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

PADIR is a special function register (SFR) to select the input/output mode of Port A.

[Description of Bits]

- **PA7DIR-PA0DIR** (bits 7-0)

The PA7DIR to PA0DIR pins are used to set the input/output direction of the Port A pin.

PA7DIR	Description
0	PA7 pin: Output (initial value)
1	PA7 pin: Input

PA6DIR	Description
0	PA6 pin: Output (initial value)
1	PA6 pin: Input

PA5DIR	Description
0	PA5 pin: Output (initial value)
1	PA5 pin: Input

PA4DIR	Description
0	PA4 pin: Output (initial value)
1	PA4 pin: Input

PA3DIR	Description
0	PA3 pin: Output (initial value)
1	PA3 pin: Input

PA2DIR	Description
0	PA2 pin: Output (initial value)
1	PA2 pin: Input

PA1DIR	Description
0	PA1 pin: Output (initial value)
1	PA1 pin: Input

PA0DIR	Description
0	PA0 pin: Output (initial value)
1	PA0 pin: Input

23.2.4 Port A Control Registers 0, 1 (PACON0, PCON1)

Address: 0F252H
Access: R/W
Access size: 8/16 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
PACON0	PA7C0	PA6C0	PA5C0	PA4C0	PA3C0	PA2C0	PA1C0	PA0C0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

Address: 0F253H
Access: R/W
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
PACON1	PA7C1	PA6C1	PA5C1	PA4C1	PA3C1	PA2C1	PA1C1	PA0C1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

PACON0 and PACON1 are special function registers (SFRs) to select input/output state of the Port A pin. The input/output state is different between input mode and output mode. Input or output is selected by using the PADIR register.

[Description of Bits]

- **PA7C1-PA0C1, PA7C0-PA0C0** (bits 7-0)

The PA7C1 to PA0C1 pins and the PA7C0 to PA0C0 pins are used to select high-impedance output, P-channel open drain output, N-channel open drain output, or CMOS output in output mode and to select high-impedance input, input with a pull-down resistor, or input with a pull-up resistor in input mode.

Setting of PA7 pin		When output mode is selected (PA7DIR bit = "0")	When input mode is selected (PA7DIR bit = "1")
PA7C1	PA7C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

Setting of PA6 pin		When output mode is selected (PA6DIR bit = "0")	When input mode is selected (PA6DIR bit = "1")
PA6C1	PA6C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

Setting of PA5 pin		When output mode is selected (PA5DIR bit = "0")	When input mode is selected (PA5DIR bit = "1")
PA5C1	PA5C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

Setting of PA4 pin		When output mode is selected (PA4DIR bit = "0")	When input mode is selected (PA4DIR bit = "1")
PA4C1	PA4C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

Setting of PA3 pin		When output mode is selected (PA3DIR bit = "0")	When input mode is selected (PA3DIR bit = "1")
PA3C1	PA3C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

Setting of PA2 pin		When output mode is selected (PA2DIR bit = "0")	When input mode is selected (PA2DIR bit = "1")
PA2C1	PA2C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

Setting of PA1 pin		When output mode is selected (PA1DIR bit = "0")	When input mode is selected (PA1DIR bit = "1")
PA1C1	PA1C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

Setting of PA0 pin		When output mode is selected (PA0DIR bit = "0")	When input mode is selected (PA0DIR bit = "1")
PA0C1	PA0C0	Description	
0	0	High-impedance output (initial value)	High-impedance input
0	1	P-channel open drain output	Input with a pull-down resistor
1	0	N-channel open drain output	Input with a pull-up resistor
1	1	CMOS output	High-impedance input

23.3 Description of Operation

23.3.1 Input/Output Port Functions

For each pin of Port A, either output or input is selected by setting the Port A direction register (PADIR).

In output mode, high-impedance output mode, P-channel open drain output mode, N-channel open drain output mode, or CMOS output mode can be selected by setting the Port A control registers 0 and 1 (PACON0 and PACON1).

In input mode, high-impedance input mode, input mode with a pull-down resistor, or input mode with a pull-up resistor can be selected by setting the Port A control registers 0 and 1 (PACON0 and PACON1).

At system reset, high-impedance output mode is selected as the initial state.

In output mode, “L” or “H” level is output to each pin of Port A depending on the value set by the Port A data register (PAD).

In input mode, the input level of each pin of Port A can be read from the Port A data register (PAD).

Chapter 24

Melody Driver

24. Melody Driver

24.1 Overview

This LSI includes one channel of the melody driver.

To use the melody driver, the secondary function of port 2 should be set. For the secondary function of port 2, see Chapter 20, "Port 2". For the clock to be used in this melody driver, see Chapter 6, "Clock Generation Circuit".

24.1.1 Features

- In melody output mode, 29 scales (melody audio frequency: 508Hz to 32.768kHz), 63 tone lengths, and 15 tempos) are available.
- In buzzer output mode, 4 output modes, 8 frequencies, and 15 duties can be set.

24.1.2 Configuration

Figure 24-1 shows the configuration of the melody driver.

Figure 24-1 Configuration of Melody Driver

24.1.3 List of Pins

Pin name	I/O	Description
P22/MD0	O	Melody 0 signal output pin Used as the secondary of the P22 pin.

24.2 Description of Registers

24.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F2C0H	Melody 0 control register	MD0CON	—	R/W	8	00H
0F2C1H	Melody 0 tempo code register	MD0TMP	—	R/W	8	00H
0F2C2H	Melody 0 scale code register	MD0TON	MD0TL	R/W	8/16	00H
0F2C3H	Melody 0 tone length code register	MD0LEN		R/W	8	00H

24.2.2 Melody 0 Control Register (MD0CON)

Address: 0F2C0H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
MD0CON	—	—	—	—	—	—	BZMD	M0RUN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

MD0CON is a special function register (SFR) to control a melody and the buzzer.

[Description of Bits]

- **BZMD** (bit 1)

The BZMD bit is used to select melody mode or buzzer mode.

BZMD	Description
0	Melody mode (initial value)
1	Buzzer mode

- **M0RUN** (bit 0)

The M0RUN bit is used to control start/stop of the MD0 output.

M0RUN	Description
0	Stops MD0 output. (Initial value)
1	Starts MD0 output.

Note:

For melody output, use the 2×low-speed clock (LSCLK×2).

Enable the 2×low-speed clock by setting bit 2 (ENMLT) of frequency control register 1 (FCON1) to “1” and then start melody output by setting M0RUN to “1”.

24.2.3 Melody 0 Tempo Code Register (MD0TMP)

Address: 0F2C1H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
MD0TMP	—	—	—	—	M0TM3	M0TM2	M0TM1	M0TM0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

MD0TMP is a special function register (SFR) to set the tempo code of a melody when melody mode is selected and the output mode of a buzzer sound waveform when buzzer mode is selected.

[Description of Bits]

- **M0TM3, M0TM2, M0TM1, M0TM0** (bits 3-0)

When melody mode is selected (BZMD bit = "0")				
M0TM3	M0TM2	M0TM1	M0TM0	Description
0	0	0	0	♪ = 480 (initial value)
0	0	0	1	♪ = 480
0	0	1	0	♪ = 320
0	0	1	1	♪ = 240
0	1	0	0	♪ = 192
0	1	0	1	♪ = 160
0	1	1	0	♪ ≅ 137
0	1	1	1	♪ = 120
1	0	0	0	♪ ≅ 107
1	0	0	1	♪ = 96
1	0	1	0	♪ ≅ 87
1	0	1	1	♪ = 80
1	1	0	0	♪ ≅ 74
1	1	0	1	♪ ≅ 69
1	1	1	0	♪ = 64
1	1	1	1	♪ = 60

When buzzer mode is selected (BZMD bit = "1")				
M0TM3	M0TM2	M0TM1	M0TM0	Description
*	*	0	0	Intermittent 1 output (initial value)
*	*	0	1	Intermittent 2 output
*	*	1	0	Single sound output
*	*	1	1	Continuous sound output

24.2.4 Melody 0 Scale Code Register (MD0TON)

Address: 0F2C2H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
MD0TON	—	M0TN6	M0TN5	M0TN4	M0TN3	M0TN2	M0TN1	M0TN0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

MD0TON is a special function register (SFR) to set the scale code of a melody when melody mode is selected and a buzzer output frequency when buzzer mode is selected.

[Description of Bits]

- **M0TN6, M0TN5, M0TN4, M0TN3, M0TN2, M0TN1, M0TN0** (bits 6-0)

When melody mode is selected (BZMD bit = "0")	
M0TN6 to 0	Description
	Sets the corresponding scale code.

For scale codes, see Section 24.3.4, "Scale Codes".

When buzzer mode is selected (BZMD bit = "1")				
M0TN6 to 3	M0TN2	M0TN1	M0TN0	Description
*	0	0	0	4.096 kHz (initial value)
*	0	0	1	2.048 kHz
*	0	1	0	1.365 kHz
*	0	1	1	1.024 kHz
*	1	0	0	819 Hz
*	1	0	1	683 Hz
*	1	1	0	585 Hz
*	1	1	1	512 Hz

Note: In buzzer mode, the M0TN6 to M0TN3 bits are not used.(Don't care)

24.2.5 Melody 0 Tone Length Code Register (MD0LEN)

Address: 0F2C3H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
MD0LEN	—	—	M0LN5	M0LN4	M0LN3	M0LN2	M0LN1	M0LN0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

MD0LEN is a special function register (SFR) to set the tone length code of a melody when melody mode is selected and buzzer output duty when buzzer mode is selected.

[Description of Bits]

- **M0LN5, M0LN4, M0LN3, M0LN2, M0LN1, M0LN0** (bits 5-0)

When melody mode is selected (BZMD bit = "0")	
M0LN5 to 0	Description
	Sets the corresponding tone length code.

For tone length codes, see Section 24.3.3, "Tone Length Codes".

When buzzer mode is selected (BZMD bit = "1")					
M0LN5 to 4	M0LN3	M0LN2	M0LN1	M0LN0	Description
*	0	0	0	0	1/16 DUTY (initial value)
*	0	0	0	1	1/16 DUTY
*	0	0	1	0	2/16 DUTY
*	0	0	1	1	3/16 DUTY
*	0	1	0	0	4/16 DUTY
*	0	1	0	1	5/16 DUTY
*	0	1	1	0	6/16 DUTY
*	0	1	1	1	7/16 DUTY
*	1	0	0	0	8/16 DUTY
*	1	0	0	1	9/16 DUTY
*	1	0	1	0	10/16 DUTY
*	1	0	1	1	11/16 DUTY
*	1	1	0	0	12/16 DUTY
*	1	1	0	1	13/16 DUTY
*	1	1	1	0	14/16 DUTY
*	1	1	1	1	15/16 DUTY

Note: In buzzer mode, the M0LN5 to M0LN4 bits are not used.(Don't care)

24.3 Description of Operation

24.3.1 Operation of Melody Output

Melody is output in the following procedure.

- (1) Select melody mode by setting the BZMD bit of the melody 0 control register (MD0CON) to "0".
- (2) Set a melody tempo in the melody 0 tempo code register (MD0TMP).
- (3) Set a tone length code in the melody 0 tone length code register (MD0LEN).
- (4) Set a scale code in the melody 0 scale code register (MD0TON).
- (5) Set bit 2 (ENMLT) of the frequency control register 1(FCON1) to "1" to enable the 2×low-speed clock.
- (6) When the M0RUN bit of the melody 0 control register (MD0CON) is set to "1", the tone length code and scale code are transferred to the tone length buffer and scale buffer and melody output is started from the MD0 pin. At the same time, a melody 0 interrupt (MD0INT) is requested. When an interrupt occurs and program is passed to the interrupt routine, the interrupt request flag is cleared.

The melody 0 signal output pin (MD0) is assigned as the secondary function of Port 2. See Chapter 20, "Port 2," for the secondary function settings of Port 2.

In the software processing after melody 0 interrupt, the tone length code and the scale code of the note that are output next are set to MD0LEN and MD0TON, respectively. When there is no next note to be output, rest data "00H" is set in MD0TON, the M0RUN bit is set to "0" by the software processing after the next melody 0 interrupt, and melody output is terminated.

By setting the M0RUN bit to "0", melody can be terminated forcibly during melody output.

In the case the melody is forcibly terminated, melody circuit must be reset once by setting DMD0 bit of BLKCON3 register to "1". Then if you want continue to use the melody function, reset the DMD0 bit to "0" and restart operating from the aforementioned procedure (1).

Figure 24-2 shows the operation waveform of the melody driver.

Figure 24-2 Operation Waveform of Melody Driver

24.3.2 Tempo Codes

A tempo code is set in the melody 0 tempo code register (MD0TMP).

Table 24-1 shows the correspondence between tempos and tempo codes.

The tempo when all the bits are set to "0" is equal to the shortest tone length (the tempo when the only M0TP0 bit is set to "1").

Table 24-1 Correspondence between Tempos and Tempo Codes

Tempo	Tempo code (MD0TMP)				
	M0TP3	M0TP2	M0TP1	M0TP0	M0TP3 to 0
 = 480	0	0	0	0	0H
 = 480	0	0	0	1	1H
 = 320	0	0	1	0	2H
 = 240	0	0	1	1	3H
 = 192	0	1	0	0	4H
 = 160	0	1	0	1	5H
 ≐ 137	0	1	1	0	6H
 = 120	0	1	1	1	7H
 ≐ 107	1	0	0	0	8H
 = 96	1	0	0	1	9H
 ≐ 87	1	0	1	0	AH
 = 80	1	0	1	1	BH
 ≐ 74	1	1	0	0	CH
 ≐ 69	1	1	0	1	DH
 = 64	1	1	1	0	EH
 = 60	1	1	1	1	FH

24.3.3 Tone Length Codes

A tone length code is set in the melody 0 tone length code register (MD0LEN).

Table 24-2 shows the correspondence between tone lengths and tone length codes.

The tone length when all the bits are set to "0" is equal to the shortest tone length (the tone length when the only M0LN0 bit is set to "1").

Table 24-2 Correspondence between Tone Lengths and Tone Length Codes

Tone length	Tone length code (MD0LEN)						
	M0LN5	M0LN4	M0LN3	M0LN2	M0LN1	M0LN1	M0LN5-0
	1	1	1	1	1	1	3FH
	1	0	1	1	1	1	2FH
	0	1	1	1	1	1	1FH
	0	1	0	1	1	1	17H
	0	0	1	1	1	1	0FH
	0	0	1	0	1	1	0BH
	0	0	0	1	1	1	07H
	0	0	0	1	0	1	05H
	0	0	0	0	1	1	03H
	0	0	0	0	1	0	02H
	0	0	0	0	0	1	01H

The tone length set by a tone length code and a tempo code is expressed by the following equation.

$$\text{Tone length} = 1.953125 \times (\text{TP} + 1) \times (\text{LN} + 1) \text{ ms}$$

where TP is an integer of 1 to 15, and LN is an integer of 1 to 63.

The bit correspondence between TP and tempo codes is expressed by the following equation.

$$\text{TP} = 2^3\text{M0TP3} + 2^2\text{M0TP2} + 2^1\text{M0TP1} + 2^0\text{M0TP0}$$

The bit correspondence between LN and tone length codes is expressed by the following equation.

$$\text{LN} = 2^5\text{M0LN5} + 2^4\text{M0LN4} + 2^3\text{M0LN3} + 2^2\text{M0LN2} + 2^1\text{M0LN1} + 2^0\text{M0LN0}$$

24.3.4 Scale Codes

A scale code is set in the melody 0 scale code register (MD0TON).

In the melody driver, a frequency that can be output is expressed by the following equation.

$$\frac{65536}{(TN + 1)} \text{ Hz} \quad (\text{where TN is an integer of 4 to 127.})$$

The bit correspondence between TN and scale codes is expressed by the following equation.

$$TN = 2^6 M0TN6 + 2^5 M0TN5 + 2^4 M0TN4 + 2^3 M0TN3 + 2^2 M0TN2 + 2^1 M0TN1 + 2^0 M0TN0$$

Table 24-3 shows the correspondence between scales and scale codes.

When the M0TN6 to M0TN2 bits are set to "0", scale becomes a rest. The rest length is set by the tone length code (MD0LEN).

Table 24-3 Correspondence between Scales and Scale Codes

Scale	Frequency (Hz)	Scale code (MD0TON)							
		M0TN6	M0TN5	M0TN4	M0TN3	M0TN2	M0TN1	M0TN0	M0TN6-0

 G ²	1	1	1	1	1	1	0	1	0	1	0	0	0	3F28H	

24.3.6 Operations of Buzzer Output

A buzzer sound is output in the following procedure.

- (1) Select a buzzer mode by setting the BZMD bit of the melody 0 control register (MD0CON) to "1".
- (2) Select a buzzer output mode using the melody 0 tempo code register (MD0TMP).
- (3) Select a duty of the High level width of the buzzer output waveform using the melody 0 tone length code register (MD0LEN).
- (4) Set the buzzer output frequency in the melody 0 scale code register (MD0TON).
- (5) Set bit 2 (ENMLT) of the frequency control register 1 (FCON1) to "1" to enable the 2×low-speed clock.
- (6) When the M0RUN bit of the melody 0 control register (MD0CON) is set to "1", the waveform equivalent to the buzzer sound that is set from the MD0 pin is output.

Figure 24-4 shows the output waveform of each buzzer output mode.

Figure 24-4 Output Waveform of Each Buzzer Output Mode

24.4 Specifying port registers

When you want to make sure the Melody/Buzzer function is working, please check related port registers are specified. See Chapter 20, "Port 2" for detail about the port registers.

24.4.1 Functioning P22 (MD0) as the Melody or Buzzer output

Set P22MD bit (bit2 of P2MOD register) to "1" for specifying the melody or buzzer output as the secondary function of P22.

Reg. name	P2MOD register (Address: 0F214H)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	P22MD	P21MD	P20MD
Data	-	-	-	-	-	1	*	*

Set P22C1 bit (bit2 of P2CON1 register) to "1" and set P22C0 bit (bit2 of P2CON0 register) to "1", for specifying the P22 as CMOS output.

Reg. name	P2CON1 register (Address: 0F213H)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	P22C1	P21C1	P20C1
Data	-	-	-	-	-	1	*	*

Reg. name	P2CON0 register (Address: 0F212H)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	P22C0	P21C0	P20C0
Data	-	-	-	-	-	1	*	*

Data of P22D bit (bit2 of P2D register) does not affect to the melody or buzzer function, so don't care the data for the function.

Reg. name	P2D register (Address: 0F210H)							
Bit	7	6	5	4	3	2	1	0
Bit name	-	-	-	-	-	P22D	P21D	P20D
Data	-	-	-	-	-	**	*	*

- : Bit does not exist.

* : Bit not related to the melody or buzzer function

** : Don't care the data.

Note:

- P22(Port2) is an output-only port, does not have an register to select the data direction(input or output).
- The output characteristics of port22 corresponds to VOL1 and VOH1 when P22MD bit is "1" (melody/buzzer is selected as the 2nd function), and corresponds to VOL2 and VOH2 when the P22MD bit is "0", which are shown in Appendix C, "Electrical Characteristics".

RC Oscillation Type A/D Converter

25. RC Oscillation Type A/D Converter

25.1 Overview

This LSI has a built-in 2-channel RC oscillation type A/D converter (RC-ADC).

The RC-ADC converts resistance values or capacitance values to digital values by counting the oscillator clock whose frequency changes according to the resistor or capacitor connected to the RC oscillator circuits. By using a thermistor or humidity sensor as a resistor, a thermometer or hygrometer can be formed.

In addition, a different sensor for each of the two channels of RC-ADC's RC oscillator circuit can be used to broaden RC-ADC applications; for example, the converter can be used for expansion of measurement range or measurement at two points.

For input clock, see Chapter 6, "Clock Generation Circuit."

25.1.1 Features

- 2-channel system by time division

25.1.2 Configuration

The RC-ADC consists of two RC oscillator circuits to form two channels, Counter A (RADCA0–2) and Counter B (RADCB0–2) as 24-bit binary counters, and an RC-ADC control circuit (RADCON, RADMOD). Figure 25-1 shows the configuration of the RC-ADC.

Figure 25-1 Configuration of RC-ADC

25.1.3 List of Pins

Pin name	I/O	Description
P30/IN0	I	Channel 0 oscillation input pin. Used for the secondary function of the P30 pin.
P31/CS0	O	Channel 0 reference capacitor connection pin. Used for the secondary function of the P31 pin.
P32/RS0	O	Channel 0 reference resistor connection pin. Used for the secondary function of the P32 pin.
P33/RT0	O	Pin for connection with a resistive sensor for measurement on Channel 0. Used for the secondary function of the P33 pin.
P34/RCT0	O	Pin for connection with a resistive/capacitive sensor for measurement on Channel 0. Used for the secondary function of the P34 pin.
P35/RCM	O	RC oscillation monitor pin. Used for the secondary function of the P35 pin.
P44/IN1	I	Channel 1 oscillation input pin. Used for the secondary function of the P44 pin.
P45/CS1	O	Channel 1 reference capacitor connection pin. Used for the secondary function of the P45 pin.
P46/RS1	O	Channel 1 reference resistor connection pin. Used for the secondary function of the P46 pin.
P47/RT1	O	Pin for connection with a resistive sensor for measurement on Channel 1. Used for the secondary function of the P47 pin.

25.2 Description of Registers

25.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F300H	RC-ADC Counter A register 0	RADCA0	—	R/W	8	00H
0F301H	RC-ADC Counter A register 1	RADCA1	—	R/W	8	00H
0F302H	RC-ADC Counter A register 2	RADCA2	—	R/W	8	00H
0F304H	RC-ADC Counter B register 0	RADCB0	—	R/W	8	00H
0F305H	RC-ADC Counter B register 1	RADCB1	—	R/W	8	00H
0F306H	RC-ADC Counter B register 2	RADCB2	—	R/W	8	00H
0F308H	RC-ADC mode register	RADMOD	—	R/W	8	00H

Initial value	0	0	0	0	0	0	0	0

RADCA0–2, which serve as a 24-bit binary counter (Counter A), are special function registers (SFRs) used to perform read/write operations to Counter A itself.

Note:

After writing data into the RC-ADC counter A register, be sure to read it to check that the data has been written correctly.

When A/D conversion starts after data is written, the value that has been written is read during A/D conversion (RARUN = 1).

When A/D conversion terminates (RARUN = 0), the count value is read.

25.2.3 RC-ADC Counter B Registers (RADCB0–2)

Address: 0F304H
Access: R/W
Access size: 8 bits
Initial value: 00H

RADCB0–2, which serve as a 24-bit binary counter (Counter B), are special function registers (SFRs) used to perform read/write operations to Counter B itself.

Note:

After writing data into the RC-ADC counter B register, be sure to read it to check that the data has been written correctly.

When A/D conversion starts after data is written, the value that has been written is read during A/D conversion (RARUN = 1).

When A/D conversion terminates (RARUN = 0), the count value is read.

25.2.4 RC-ADC Mode Register (RADMOD)

Address: 0F308H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
RADMOD	RACK2	RACK1	RACK0	RADI	OM3	OM2	OM1	OM0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

RADMOD is a special function register (SFR) used to select an A/D conversion mode of the RC-ADC.

[Description of Bits]

- **OM3-0** (bits 3-0)

The OM3-0 bits are used to select an oscillation mode for the RC oscillator circuits.

OM3	OM2	OM1	OM0	Description
0	0	0	0	IN0 pin external clock input mode (initial value)
0	0	0	1	RS0-CS0 oscillation mode
0	0	1	0	RT0-CS0 oscillation mode
0	0	1	1	RT ₀₋₁ -CS0 oscillation mode
0	1	0	0	RS0-CT0 oscillation mode
0	1	0	1	RS1-CS1 oscillation mode
0	1	1	0	RT1-CS1 oscillation mode
0	1	1	1	IN1 pin external clock input mode
1	*	*	*	Setting prohibited

- **RADI** (bit 4)

The RADI bit is used to choose whether to generate the RC-ADC interrupt request signal (RADINT) by an overflow at Counter A or Counter B.

RADI	Description
0	Generates an interrupt request by Counter A overflow (initial value).
1	Generates an interrupt request by Counter B overflow.

- **RACK2-0** (bits 7-5)

The RACK2-0 bits are used to select the base clock of Conter A (BSCLK).

RACK2	RACK1	RACK0	Description
0	0	0	LSCLK (initial value)
0	0	1	LSCLK×2
0	1	0	HSCLK
0	1	1	1/2HSCLK
1	0	0	1/4HSCLK
1	0	1	1/8HSCLK
1	1	*	Setting prohibited (no clock is supplied)

Note:

When specifying LSCLK×2 for the base clock, enable the operation of the 2×low-speed clock by setting bit 2 (ENMLT) of the frequency control register 1 (FCON1) to "1".

25.2.5 RC-ADC Control Register (RADCON)

Address: 0F309H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
RADCON	—	—	—	—	—	—	—	RARUN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

RADCON is a special function register (SFR) used to control A/D conversion operation of the RC-ADC.

[Description of Bits]

- **RARUN** (bit 0)

The RARUN bit is used to start or stop A/D conversion of the RC-ADC. When RARUN is set to “1”, A/D conversion starts and when set to “0”, A/D conversion stops. If Counter A or Counter B overflows with RARUN set to “1”, the bit is automatically reset to “0”.

RARUN is set to “0” at system reset.

RARUN	Description
0	Stops A/D conversion (initial value).
1	Starts A/D conversion.

25.3 Description of Operation

Counter A (RADCA0–2) is a 24-bit binary counter for counting the base clock (BSCLK), which is used as the standard of time. Counter A can count up to 0FFFFFFFH.

Counter B (RADCB0–2) is a 24-bit binary counter for counting the oscillator clock (RCCLK) of the RC oscillator circuits. Counter B can count up to 0FFFFFFFH.

Counters A and B are provided with overflow flags (OVFA and OVFB, respectively). Each overflow output results in generation of an RC-ADC interrupt request signal (RADINT). Use the RADI bit of the RC-AC mode register (RADMOD) to select whether to generate an overflow interrupt by an overflow on Counter A or Counter B: setting RADI to “0” specifies Counter A overflow and setting it to “1” specifies Counter B overflow.

The RARUN bit of the RC-AD control register (RADCON) is used to start or stop RC-ADC conversion operation. When RARUN is set to “0”, the oscillator circuits stop, so that counting will not be performed. When RARUN is set to “1”, RC oscillation starts, when the RC oscillator clock (RCCLK) and the base clock (BSCLK) start counting through Counter B and Counter A.

The RC oscillation section has a total of eight types of oscillation modes based on the two oscillator circuits of RCOSC0 and RCOSC1, and mode selection is made by the RC-ADC mode register (RADMOD).

P30–34, P44–47, and P35 must be configured as their secondary function input or output when using 1) the RC oscillator circuit RCOSC0, 2) the RC oscillator circuit RCOSC1, and 3) the RC monitor pin (RCM) that outputs RC oscillation waveforms, respectively. For the configuration of the RC oscillator circuits, see Section 25.1.2, “Configuration”; for the secondary functions of Port 3, see Chapter 21, “Port 3”; for the secondary functions of Port 4, see Chapter 22, “Port 4”.

25.3.1 RC Oscillator Circuits

RC-ADC performs A/D conversion by converting the oscillation frequency ratio between a reference resistor (or capacitor) and a resistive sensor (or capacitive sensor) such as a thermistor to digital data.

By making RC oscillation occur both on the reference side and on the sensor side with the reference capacitor the error factor that the RS oscillator circuit itself is eliminated, thereby making it possible to perform the A/D conversion of the characteristics of the sensor itself.

Also, by calculating the ratio between the oscillation frequency on the reference side and that on the sensor side and then calculating the correlation between the calculated ratio and temperatures that the sensor characteristics have in advance, a temperature can be obtained based on that calculated ratio.

Table 25-1 lists the eight types of oscillation modes, one of which is selected by the RC-ADC mode register (RADMOD) OM3–0 bits.

Table 25-1 Oscillation Modes from Which Selection Is Made by OM3–0 Bits

Mode No.	RADMOD				RCOSC0 output pin				RCOSC1 output pin			Mode	
	OM3	OM2	OM1	OM0	RS0	RT0	CRT0	CS0	RS1	RT1	CS1		
0	0	0	0	0	Z	Z	Z	Z	Z	Z	Z	IN0 external clock input mode	
1	0	0	0	1	1/0	Z	Z	0/1	Z	Z	Z	RS0–CS0 oscillation	RCOSC0 oscillation mode
2	0	0	1	0	Z	1/0	Z	0/1	Z	Z	Z	RT0–CS0 oscillation	
3	0	0	1	1	Z	Z	1/0	0/1	Z	Z	Z	RT ₀₋₁ –CS0 oscillation	
4	0	1	0	0	1/0	Z	0/1	Z	Z	Z	Z	RS0–CT0 oscillation	
5	0	1	0	1	Z	Z	Z	Z	1/0	Z	0/1	RS1–CS1 oscillation	RCOSC1 oscillation mode
6	0	1	1	0	Z	Z	Z	Z	Z	1/0	0/1	RT1–CS1 oscillation	
7	0	1	1	1	Z	Z	Z	Z	Z	Z	Z	IN1 external clock input mode	
8	1	*	*	*	Z	Z	Z	Z	Z	Z	Z	(Setting prohibited)	

Note) * : Indicates “arbitrary.”
Z : Indicates high-impedance output.
1/0, 0/1 : Indicates active output.
(Setting prohibited) : The oscillator clock is not supplied even by setting the RARUN bit to “1” or by starting A/D conversion.

In Table 25-1, mode No.0 and mode No.7 are modes where external clocks to be input to the IN0 or IN1 pin are used for measurement with the RC oscillator circuit stopped.

As shown in Table 25-1, the two oscillator circuits, RCOSC0 and RCOSC1, are so specified that they cannot operate concurrently in order to prevent interference in oscillation from occurring when they oscillate concurrently.

The relationship between an oscillation frequency f_{RCCLK} and an RC constant is expressed by the following equation:

$$\frac{1}{f_{RCCLK}} = t_{RCCLK} = k_{RCCLK} \cdot R \cdot C$$

where t_{RCCLK} is the period of the oscillator clock, k_{RCCLK} the proportional constant, and $R \cdot C$ the product of capacitances $CS, CT, (CS+CVR)$ and $(CT+CVR)$ and resistances RS and RT . $CS, CT, (CS+CVR), (CT+CVR), RS$, and RT concern oscillation. The value of k_{RCCLK} slightly changes depending on the value of the supply voltage V_{DD} , RI, R , or C . Table 25-2 lists the typical k_{RCCLK} values.

Table 25-2 Typical Values of the Proportional Constant k_{RCCLK} of RC Oscillator Circuits

V_{DD} (V)	R_{In} (k Ω)	CS_n, CT_n (pF)	CVR_n (pF)	RS_n, RT_n (k Ω)	k_{RCCLK} (Typ.)
3	10	560	820	100	1.2
		560	820	10	1.2
1.5	10	560	820	100	1.2
		560	820	10	1.3

Note) $n = 0, 1$

Notes:

- Out of the Port 3 and Port 4 pins, pins that are to be used for the RC-ADC function must be configured as secondary function input or output using the mode register (P3MOD0, P3MOD1, P4MOD0, P4MOD1) of the corresponding port.
- All the Port 3 pins except P35/RCM (see Section 25.1.3, "List of Pins") are configured as pins dedicated to the RC-ADC function during A/D conversion. Therefore, during A/D conversion, all the Port 3 pins except P35 cannot be used as their primary functions in oscillation mode No. 0, 1, 2, 3 or 4, which is selected by the RADMOD register. In the same way, the P44 to P47 pins of Port 4 cannot be used as their primary functions in oscillation mode No. 5, 6 or 7.

Figures 25-2 to 25-5 show the oscillator circuit configurations, the modes of oscillation for each configuration, and the OM3–0 bit settings.

Figure 25-2 When RCOSC0 Is Used for Measurement with One Resistive Sensor

Note:

The unused pin RCT0 shown in the figure above is configured as a pin dedicated to the RC-ADC function during A/D conversion; therefore, during A/D conversion, RCT0 cannot be used as a port (P34).

Figure 25-3 When RCOSC0 Is Used for Measurement with One Resistive Sensor (Two points are adjusted with two reference resistors)

Figure 25-4 When RCOSC0 Is Used for Measurement with One Capacitive Sensor

Note:

The unused pin RT0 shown in the figure above is configured as a pin dedicated to the RC-ADC function during A/D conversion; therefore, during A/D conversion, RT0 cannot be used as a port (P33).

Figure 25-5 When RCOSC1 Is Used for Measurement with One Resistive Sensor

25.3.2 Counter A/Counter B Reference Modes

There are the following two modes of RC-ADC conversion operation:

- Counter A reference mode (RADMOD RADI = "0")
In this mode, a gate time is determined by Counter A and the base clock (BSCLK), which is used as the time reference, then the RC oscillator clock (RCCLK) is counted by Counter B within the gate time to make the content of Counter B an A/D conversion value.
The A/D conversion value is proportional to RC oscillation frequency.
- Counter B reference mode (RADMOD RADI = "1")
In this mode, a gate time is determined by Counter B and the RC oscillator clock (RCCLK), and the base clock (BSCLK), which is used as the time reference, is counted by Counter A within the gate time to make the content of Counter A an A/D conversion value.
The /D conversion value is inversely proportional to RC oscillation frequency.

(1) Operation in Counter A reference mode

Figure 25-6 shows the operation timing in Counter A reference mode.

Following is an example of operation procedure in Counter A reference mode:

- ① Preset to Counter A (RADCA2-0) the value obtained by subtracting the count value "nA0" from the maximum value + 1 (1000000H). The product of the count value "nA0" and the BSCLK clock period indicates the gate time.
- ② Preset "000000H" to Counter B (RADCB2-0).
- ③ Set the OM3-OM0 bits of RADMOD to desired oscillation mode (see Table 25-1).
- ④ Set the RADI bit of RADMOD to "0" to specify generating of an interrupt request signal by Counter A overflow.
- ⑤ Set the RARUN bit of RADCON to "1" to start A/D conversion.

Counter A starts counting of the base clock (BSCLK) when RARUN is set to “1” and the RCON signal (signal synchronized with the fall of the base clock) is set to “1”. When Counter A overflows, the RARUN bit is automatically reset to “0” (⑥) and counting is terminated. At the same time, an RC-ADC interrupt request (RADINT) occurs (⑦).

When the RCON signal is set to “1”, the RC oscillator circuit starts operation and Counter B starts counting of the RC oscillator clock (RCCLK). When the RARUN bit is reset to “0” due to overflow of Counter A, RC oscillation stops and Counter B stops counting.

The final count value “nB0” of Counter B is the RCCLK count value during the gate time “nA0•t_{BSCLK}” and is expressed by the following expression:

$$nB0 \cong nA0 \cdot \frac{t_{BSCLK}}{t_{RCCLK}} \propto f_{RCCLK}$$

where t_{BSCLK} indicates the BSCLK period and t_{RCCLK} the RCCLK period. That is, “nB0” is a value proportional to the RC oscillation frequency f_{RCCLK}.

Figure 25-6 Operation Timing in Counter A Reference Mode

(2) Operation in Counter B reference mode

Figure 25-7 shows the operation timing in Counter B reference mode.

Following is an example of operation procedure in Counter B reference mode:

- ① Preset to Counter B (RADCB2–0) the value obtained by subtracting the count value “nB1” from the maximum value + 1 (1000000H). The product of the count value “nB1” and the RCCLK clock period indicates the gate time.
- ② Preset “000000H” to Counter A (RADCA2–0).
- ③ Set the OM3–OM0 bits of RADMOD to desired oscillation mode (see Table 25-1).
- ④ Set the RADI bit of RADMOD to “1” to specify generating of an interrupt request signal by Counter B overflow.
- ⑤ Set the RARUN bit of RADCON to “1” to start A/D conversion.

When the RARUN bit is set to “1” and the RCON signal (signal synchronized with the fall of the base clock) is set to “1”, the RC oscillator circuit starts operation and Counter B starts counting of the RC oscillator clock (RCCLK). When Counter B overflows, the RARUN bit is automatically reset (Ⓒ) and conversion operation terminates. At the same time, an RC-ADC interrupt request (RADINT) occurs. (Ⓓ)

When the RCON signal is set to “1”, Counter A starts counting of the base clock (BSCLK). When the RARUN bit is reset due to overflow of Counter B, Counter A stops counting.

The final count “nA1” of Counter A is the CLK count value during the gate time “nB1•t_{RCCLK}” and is expressed by the following expression:

$$nA1 \cong nB1 \cdot \frac{t_{RCCLK}}{t_{BSCLK}} \propto \frac{1}{f_{RCCLK}}$$

That is, “nA1” is a value inversely proportional to the RC oscillation frequency f_{RCCLK} .

Figure 25-7 Operation Timing in Counter B Reference Mode

25.3.3 Example of Use of RC Oscillation Type A/D Converter

This section describes the method of performing A/D conversion for sensor values in Counter A and B reference modes by taking temperature measurement by a thermistor as an example.

Figure 25-8 shows the configuration of 1-thermistor RC oscillator circuit using RCOSC0.

Figure 25-8 Configuration of 1-Thermistor RC Oscillator Circuit Using RCOSC0

Figure 25-9 shows the temperature characteristics of the thermistor resistance RT0.

Figure 25-9 Temperature Characteristics of Thermistor

Figure 25-10 A/D Conversion Characteristics (Ideal characteristics when nT0 is proportional to RT0)

RT0 is expressed as a function of temperature T by the following equation:

$$RT0 = f(T)$$

Figure 25-10 shows the ideal characteristics of A/D conversion with the assumption that RT0 is an analog quantity. In the ideal characteristics, the A/D conversion value nT0 will purely depend on RT0 only. Assuming that nT0 is proportional to RT0, let proportional constant be K, then nT0 has the following relationship with temperature T:

$$nT0 = K \cdot RT0 = K \cdot f(T) \quad \dots\dots \text{Expression A}$$

Therefore, temperature T can be expressed as a digital value by performing the conversion processing that accords with the characteristics shown in Figure 25-9 for nT0 by software.

To convert from an $RT0$ value to a digital value, the ratio is used between a) the oscillation frequency by the thermistor connected to the $RT0$ pin and the capacitor connected to the $CS0$ pin and b) the oscillation frequency by the reference resistor (which ideally should have no temperature characteristics) connected to the $RS0$ pin and the capacitor connected to the $CS0$ pin. This is for making the conditions other than resistance equal to eliminate the error factor in oscillation characteristics.

As shown in Figures 25-9 and 25-11, the $RT0$ value depends on temperature T and the $RS0$ value is assumed to be constant regardless of temperature T . It is ideal if the characteristics of the oscillation frequency f_{OSC} to temperature T using these resistances will be like the solid lines in Figures 25-12 and 25-13; however, in reality, it would appear that they will be like the dotted lines due to error factors such as IC temperature characteristics.

Since the condition of f_{RCCLK} ($RT0$) and that of f_{RCCLK} ($RS0$) are the same except for the resistances, the error ratios are almost the same; therefore, errors can almost be eliminated by using the ratio between f_{RCCLK} ($RT0$) and f_{RCCLK} ($RS0$).

The ratio between f_{RCCLK} ($RT0$) and f_{RCCLK} ($RS0$) is equivalent to the above-mentioned A/D conversion value $nT0$ that should ideally depend only on $RT0$.

Figure 25-11 Temperature Characteristics of Reference Resistor

Figure 25-12 Oscillation Characteristics of Thermistor

Figure 25-13 Oscillation Characteristics of Reference Resistor

Figure 25-14 shows, as an example of method, a timing diagram of one cycle of conversion from analog value RT0 to a digital value, that is, A/D conversion.

Basically, one A/D conversion cycle must consist of two steps, as shown in Figure 25-14. The reason for requiring two steps is that the reference resistor and the thermistor must first be oscillated separately and then the ratio between the oscillation frequencies of them is used, as described above.

In the example below, operation for these two steps is performed using the following combination:

- First step = RC oscillation with RS0 in Counter A reference mode
- Second step = RC oscillation with RT0 in Counter B reference mode

Besides this, there would be several possible A/D conversion methods.

In the above method, the operation time (gate time) for the second step fluctuates depending on the value of thermistor RT0. To avoid the fluctuation of the operation time, using a method that uses the following combination is recommended:

- First step = RC oscillation with RS0 in Counter B reference mode
- Second step = RC oscillation with RT0 in Counter A reference mode

A/D conversion procedure is explained below by taking Figure 25-14 as an example.

Figure 25-14 Timing Diagram for 1 Cycle of A/D Conversion (Example)

<First Step>

- ① Set the base clock to 32.768 kHz. (Write "00H" in FCON0.)
- ② Preset "1000000H – nA0" in Counter A.
- ③ Preset "000000H" in Counter B.
- ④ Write "01H" in RADMOD to select Counter A reference mode and the oscillation mode that uses reference resistance RS0.
- ⑤ Write "01H" in RADCON to start A/D conversion operation.
- ⑥ Write "1" in the HLT bit of SBYCON (see Chapter 4, "MCU") to set the device to HALT mode.

Note:

In this example, nA0 is set to 4B0H because the gate time " $nA0 \cdot t_{BSCLK}$ " in oscillation mode with reference resistor RS0 is set to 0.3666 second. The value of nA0 is related to how much the margin of the quantization error of the A/D conversion is: the greater the nA0 value is, the smaller the margin of error becomes. To reduce noise contamination to the RC oscillator circuit caused by CPU operation, it is recommended to constantly put the device into HALT mode during operation of RC oscillation.

From this point of time, the RC oscillator circuit (RCOSC0) continues oscillation for about 0.366 second with the reference resistance RS0. Then, when Counter A overflows, the RADINT signal is set to "1" and an RC-ADC interrupt request is generated (section (a)). Also, the generation of interrupt request releases HALT mode (section (b)) and at the same time, A/D conversion operation stops (section (c), RARUN bit = "0"). At this time, Counter A is set to "000000H".

The content of Counter B at this time is expressed by the following expression:

$$nB0 = nA0 \cdot \frac{t_{BSCLK}}{t_{RCCLK}(RS0)} \quad \dots\dots \text{Expression B}$$

That completes the operations in First Step .

<Second Step>

- ⑦ Calculate "1000000H – nB0" from the content of Counter B "nB0" and set the obtained value in Counter B. At this point, Counter A needs to be cleared; however, no processing is required since the counter is already set to "000000H".
- ⑧ Write "12H" in RADMOD to select Counter B reference mode and the oscillation mode that uses thermistor RT0.
- ⑨ Write "01H" in RADCON to start A/D conversion operation.
- ⑩ Write "1" in the HLT bit of SBYCON (see Chapter 4, "MCU") to set the device to HALT mode.

The RC oscillator circuit (RCOSC0) oscillates with thermistor RT0 from this point until Counter B overflows. This period is equal to the product of "nB0" obtained in the First Step and the oscillation period t_{RCCLK} (RT0) using RT0. When Counter B overflows, the RADINT signal is set to "1" and an RC-ADC interrupt request is generated (section (d)). Also, the generation of interrupt request releases HALT mode (section (e)) and at the same time, A/D conversion operation stops (section (f), RARUN bit = "0"). This completes the operations in Second Step .

The content of Counter A at this time becomes the A/D conversion value nA1, which is expressed by the following expression:

$$nA1 = nB0 \cdot \frac{t_{RCCLK}(RT0)}{t_{BSCLK}} \quad \dots\dots \text{Expression C}$$

From expressions B and C, nA1 is expressed by the following expression:

$$nA1 = nA0 \cdot \frac{t_{RCCLK}(RT0)}{t_{RCCLK}(RS0)} \quad \dots\dots \text{Expression D}$$

where $t_{RCCLK}(RS0)$ is the oscillator clock period by reference resistor RS0 and $t_{RCCLK}(RT0)$ the oscillator clock period by thermistor RT0.

Since the oscillation period is expressed by " $t_{RCCLK} = k_{RCCLK} \cdot R \cdot C$ ", $t_{RCCLK}(RS0)$ and $t_{RCCLK}(RT0)$ are expressed by the following expressions:

$$\begin{aligned} t_{RCCLK}(RS0) &= k_{RCCLK} \cdot (CS0 + CVR) \cdot RS0 \\ t_{RCCLK}(RT0) &= k_{RCCLK} \cdot (CS0 + CVR) \cdot RT0 \end{aligned} \quad \text{..... Expression E}$$

When expression E is substituted for expression D, nA1 will be:

$$nA1 = nA0 \cdot \frac{RT0}{RS0}$$

Since "nA0" ("4B0H" in this example) and RS0 are constants whose values are fixed, "nA1" is a digital value proportional to RT0. This very "nA1" corresponds to "nT0" in expression A.

That concludes the description of the A/D conversion method using a thermistor. "nA1" that has been obtained must further be converted to a value such as a temperature indication value for thermometer by program according to the temperature-to-resistance characteristics of the themistor.

25.3.4 Monitoring RC Oscillation

The RC oscillator clock (RCCLK) can be output using the secondary function of the P35 pin of Port 3. See Chapter 21, "Port 3," for the details of the secondary function of P35.

Monitoring RC oscillation is useful for checking the characteristics of the RC oscillator circuit. That is, the relationship between a sensor, such as a thermistor, and the oscillation frequency can be measured. For instance, the coefficient for conversion from the above-described nA1 value to a temperature indication value can be obtained by checking the relationship between the ambient temperature of a themistor-incorporated RC oscillator, the oscillation frequency with thermistor RT0, and the oscillation frequency with reference resistor RS0.

Note:

- P35 (RCM) is a monitor pin for oscillation clock. The channel 0(P34-P30) and channel 1(P47-P44) share the monitor pin.
- Please use P35 (RCM) for the evaluation purpose and disable the output while operating in an actual application to minimize the noise.

25.4 Specifying port registers

When you want to make sure the RC-ADC function is working, please check related port registers are specified. See Chapter 21, "Port 3" and Chapter 22, "Port 4" for detail about the port registers.

25.4.1 Functioning P35(RCM), P34(RCT0), P33(RT0), P32(RS0), P31(CS0) and P30(IN0) as the RC-ADC(Ch0)

Set P35MD1-P30MD1 bits(bit5-bit0 of P3MOD1 register) to "0" and set P35MD0-P30MD0(bit5-bit0 of P3MOD0 register) to "1", for specifying the RC-ADC as the secondary function of P35, P34, P33, P32, P31 and P30.

Reg. name	P3MOD1 register (Address: 0F21DH)							
Bit	7	6	5	4	3	2	1	0
Bit name	P37MD1	P36MD1	P35MD1	P34MD1	P33MD1	P32MD1	P31MD1	P30MD1
Data	-	-	0	0	0	0	0	0

Reg. name	P3MOD0 register (Address: 0F21CH)							
Bit	7	6	5	4	3	2	1	0
Bit name	P37MD0	P36MD0	P35MD0	P34MD0	P33MD0	P32MD0	P31MD0	P30MD0
Data	-	-	1	1	1	1	1	1

Set P34C1-P30C1 bit(bit4-0 of P3CON1 register) to "0", set P34C0-P30C0 bit(bit4-0 of P3CON0 register) to "0", and set P34DIR-P30DIR bit(bit4-0 of P3DIR register) to "1", for specifying the P34-P30 as high-impedance inputs. The P34C1-P30C1 bit and P34C0-P30C0 bit can be set to all "1" instead of all "0" to select the high-impedance inputs. Set P35C1 bit(bit5 of P3CON1 register) to "1", set P35C0 bit(bit5 of P3CON0 register) to "1", and set P35DIR bit(bit5 of P3DIR register) to "0", for specifying the P35 as CMOS outputs.

Reg. name	P3CON1 register (Address: 0F21BH)							
Bit	7	6	5	4	3	2	1	0
Bit name	P37C1	P36C1	P35C1	P34C1	P33C1	P32C1	P31C1	P30C1
Data	-	-	1	0	0	0	0	0

Reg. name	P3CON0 register (Address: 0F21AH)							
Bit	7	6	5	4	3	2	1	0
Bit name	P37C0	P36C0	P35C0	P34C0	P33C0	P32C0	P31C0	P30C0
Data	-	-	1	0	0	0	0	0

Reg. name	P3DIR register (Address: 0F219H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P37DIR	P36DIR	P35DIR	P34DIR	P33DIR	P32DIR	P31DIR	P30DIR
Data	-	-	0	1	1	1	1	1

Data of P35D-P30D bits (bit5-0 of P3D register) do not affect to the RC-ADC function, so don't care the data for the function.

Reg. name	P3D register (Address: 0F218H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P37D	P36D	P35D	P34D	P33D	P32D	P31D	P30D
Data	-	-	**	**	**	**	**	**

- : Bit does not exist.

* : Bit not related to the RC-ADC channel 0(using P35,P34,P33,P32,P31 and P30) function

** : Don't care the data

25.4.2 Functioning P47(RT1), P46(RS1), P45(CS1) and P44(IN1) as the RC-ADC(Ch1)

Set P47MD1-P44MD1 bits(bit7-bit4 of P4MOD1 register) to "0" and set P47MD0-P44MD0(bit7-bit4 of P4MOD0 register) to "1", for specifying the RC-ADC as the secondary function of P47, P46, P45 and P44.

Reg. name	P4MOD1 register (Address: 0F225H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47MD1	P46MD1	P45MD1	P44MD1	P43MD1	P42MD1	P41MD1	P40MD1
Data	0	0	0	0	*	*	*	*

Reg. name	P4MOD0 register (Address: 0F224H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47MD0	P46MD0	P45MD0	P44MD0	P43MD0	P42MD0	P41MD0	P40MD0
Data	1	1	1	1	*	*	*	*

Set P47C1-P44C1 bit(bit7-4 of P4CON1 register) to "0", set P47C0-P44C0 bit(bit7-4 of P4CON0 register) to "0", and set P47DIR-P44DIR bit(bit7-4 of P4DIR register) to "1", for specifying the P47-P44 as high-impedance inputs. The P47C1-P44C1 bit and P47C0-P44C0 bit can be set to all "1" instead of all "0" to select the high-impedance inputs.

Reg. name	P4CON1 register (Address: 0F223H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47C1	P46C1	P45C1	P44C1	P43C1	P42C1	P41C1	P40C1
Data	0	0	0	0	*	*	*	*

Reg. name	P4CON0 register (Address: 0F222H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47C0	P46C0	P45C0	P44C0	P43C0	P42C0	P41C0	P40C0
Data	0	0	0	0	*	*	*	*

Reg. name	P4DIR register (Address: 0F221H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47DIR	P46DIR	P45DIR	P44DIR	P43DIR	P42DIR	P41DIR	P40DIR
Data	1	1	1	1	*	*	*	*

Data of P47D-P44D bits (bit7-4 of P4D register) do not affect to the RC-ADC function, so don't care the data for the function.

Reg. name	P4D register (Address: 0F220H)							
Bit	7	6	5	4	3	2	1	0
Bit name	P47D	P46D	P45D	P44D	P43D	P42D	P41D	P40D
Data	**	**	**	**	*	*	*	*

* : Bit not related to the RC-ADC channel 1(using P47,P46,P45 and P44) function

** : Don't care the data

Note:

Status of output pins P31-P34 and P45-P47 changes according to the RC oscillation mode specified by OM0-OM3 bit of RADMOD register.

Successive Approximation Type A/D Converter

26. Successive Approximation Type A/D Converter

26.1 Overview

This LSI has a built-in 2-channel successive approximation type A/D converter (SA-ADC).

The LSI, which also incorporates the amplifier that can adjust gain and offset and allows differential input to be applied, can handle various types of analog input.

26.1.1 Features

- Built-in sample/hold 12-bit successive approximation type A-D converter, which enables channel selection from 2 channels
- Built-in two-stage amplifiers which consist of 1st amplifier that handles differential amplification input and 2nd amplifier that handles offset adjustment
- At differential amplification input, offset measurement of each individual amplifier is possible by shorting the input pins.
- A combination of amplifiers enables handling of a variety of analog input.

26.1.2 Configuration

Figure 26-1 shows the configuration of SA-ADC.

SADR0L:	SA-ADC result register 0L
SADR0H:	SA-ADC result register 0H
SADR1L:	SA-ADC result register 1L
SADR1H:	SA-ADC result register 1H
SADCON0:	SA-ADC control register 0
SADCON1:	SA-ADC control register 1
SADMOD0:	SA-ADC mode register 0
AMPOFFS:	Amplifier offset register
AMPGAIN:	Amplifier gain register
AMPCON0:	Amplifier control register 0

Figure 26-1 Configuration of SA-ADC

26.1.3 List of Pins

Pin name	I/O	Description
AV_{DD}	—	Positive power supply pin for the successive approximation type A/D converter
V_{REF}	—	Reference power supply pin for the successive approximation type A/D converter
AV_{SS}	—	Negative power supply pin for the successive approximation type A/D converter
AIN0	I	Successive approximation type A/D converter input pin 0
AIN1	I	Successive approximation type A/D converter input pin 1

26.2 Description of Registers

26.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F2D0H	SA-ADC result register 0L	SADR0L	SADR0	R	8/16	00H
0F2D1H	SA-ADC result register 0H	SADR0H		R	8	00H
0F2D2H	SA-ADC result register 1L	SADR1L	SADR1	R	8/16	00H
0F2D3H	SA-ADC result register 1H	SADR1H		R	8	00H
0F2F0H	SA-ADC control register 0	SADCON0	SADCON	R/W	8/16	02H
0F2F1H	SA-ADC control register 1	SADCON1		R/W	8	00H
0F2F2H	SA-ADC mode register 0	SADMOD0	—	R/W	8	00H
0F2F4H	Amplifier offset register	AMPOFFS	—	R/W	8	03H
0F2F5H	Amplifier gain register	AMPGAIN	—	R/W	8	00H
0F2F6H	Amplifier control register 0	AMPCON0	—	R/W	8	00H

26.2.2 SA-ADC Result Register 0L (SADR0L)

Address: 0F2D0H
Access: R
Access size: 8/16 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
SADR0L	SAR03	SAR02	SAR01	SAR00	—	—	—	—
R/W	R	R	R	R	R	R	R	R
Initial value	0	0	0	0	0	0	0	0

SADR0L is a special function register (SFR) used to store SA-ADC conversion results on channel 0.
SADR0L is updated after A/D conversion.

[Description of Bits]

- **SAR03-SAR00** (bits 7-4)

The SAR03–SAR00 bits are used to store the values of bit 3 to bit 0 of A/D conversion results (12 bits) on channel 0.

26.2.3 SA-ADC Result Register 0H (SADR0H)

Address: 0F2D1H
Access: R
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
SADR0H	SAR0B	SAR0A	SAR09	SAR08	SAR07	SAR06	SAR05	SAR04
R/W	R	R	R	R	R	R	R	R
Initial value	0	0	0	0	0	0	0	0

SADR0H is a special function register (SFR) used to store SA-ADC conversion results on channel 0.
SADR0H is updated after A/D conversion.

[Description of Bits]

- **SAR0B-SAR04** (bits 7-0)

The SAR0B3–SAR04 bits are used to store the values of bit 11 to bit 4 of A/D conversion results (12 bits) on channel 0.

26.2.4 SA-ADC Result Register 1L (SADR1L)

Address: 0F2D2H
Access: R
Access size: 8/16 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
SADR1L	SAR13	SAR12	SAR11	SAR10	—	—	—	—
R/W	R	R	R	R	R	R	R	R
Initial value	0	0	0	0	0	0	0	0

SADR1L is a special function register (SFR) used to store SA-ADC conversion results on channel 1.
SADR1L is updated after A/D conversion.

[Description of Bits]

- **SAR13-SAR10** (bits 7-4)

The SAR13-SAR10 bits are used to store the values of bit 3 to bit 0 of A/D conversion results (12 bits) on channel 1.

26.2.5 SA-ADC Result Register 1H (SADR1H)

Address: 0F2D3H
Access: R
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
SADR1H	SAR1B	SAR1A	SAR19	SAR18	SAR17	SAR16	SAR15	SAR14
R/W	R	R	R	R	R	R	R	R
Initial value	0	0	0	0	0	0	0	0

SADR1H is a special function register (SFR) used to store SA-ADC conversion results on channel 1.
SADR1H is updated after A/D conversion.

[Description of Bits]

- **SAR1B-SAR14** (bits 7-0)

The SAR1B-SAR14 bits are used to store the values of bit 11 to bit 4 of A/D conversion results (12 bits) on channel 1.

26.2.6 SA-ADC Control Register 0 (SADCON0)

Address: 0F2F0H
Access: R/W
Access size: 8/16 bits
Initial value: 02H

	7	6	5	4	3	2	1	0
SADCON0	—	—	—	—	—	—	SACK	SALP
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

SADCON0 is a special function register (SFR) used to control the operation of the SA-ADC.

[Description of Bits]

- **SALP** (bit 0)

SALP	Description
0	Single A/D conversion only (Initial value)
1	Consecutive A/D conversion

This bit is used to select whether A/D conversion is performed once only for each channel or consecutively. When this bit is set to “0”, A/D conversion is performed once only for each channel and when it is set to “1”, A/D conversion is performed consecutively according to the settings of the amplifier control register 0 (AMPCON0) and SA-ADC mode register (SADMOD0).

Notes:

When amplification input or differential amplification input is selected by amplifier control register 0, the amplifier settling time is required before starting A/D conversion. So set the SALP bit to “0” without using the setting of “Consecutive A/D conversion”.

Set the SALP bit when the SARUN bit of the SADCON1 register is “0” (A/D conversion inactive).

Use the SADMOD0 register to select a channel. See Section 26.3.2, A/D Conversion Channel Settings, for the details.

- **SACK** (bit 1)

SACK	Description
0	HSCLK is set to the range of 375kHz to 625kHz.
1	HSCLK is set to the range of 1.5MHz to 4.2MHz (Initial value)

The SACK bit is used to set an A/D conversion time.

As a conversion time is set by counting HSCLK, set this bit to “0” when HSCLK is set in the range of 375kHz to 625kHz and when HSCLK is set in the range of 1.5MHz to 4.2MHz, set this bit to “1”.

Note:

Set the SACK bit when the SARUN bit of the SADCON1 register is “0” (A/D conversion inactive).

SA-ADC is available only when VDD=1.8V to 3.6V and HSCLK is in the ranges of 375KHz to 625kHz and of 1.5MHz to 4.2MHz.

26.2.7 SA-ADC Control Register 1 (SADCON1)

Address: 0F2F1H
Access: R/W
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
SADCON1	—	—	—	—	—	—	—	SARUN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

SADCON1 is a special function register (SFR) used to control the operation of the SA-ADC.

[Description of Bits]

- **SARUN** (bit 0)

SARUN	Description
0	Stops conversion. (Initial value)
1	Starts conversion.

The SARUN bit is used to start or stop SA-ADC conversion. Setting this bit to “1” starts A/D conversion and setting it to “0” stops A/D conversion.

When SALP of SADCON0 is “0” and then A/D conversion on the channel with the largest channel number among the selected ones is terminated, the SARUN bit is automatically set to “0”.

Notes:

Use the SA-ADC with high-speed clock oscillation (HSCLK) enabled in the frequency control register (FCON0).

The SA-ADC is available only when $V_{DD} = 1.8$ to 3.6 V and HSCLK is in the ranges of 3.75kHz to 625kHz and of 1.5MHz to 4.2 MHz.

Do not start A/D conversion in the state in which bits 1 (SACH1) and 0 (SACH0) of SA-ADC mode register 0 are “0” and “0” respectively. When A/D conversion is started in this state, A/D conversion is not done while the A/D converter is activated. Therefore, the SA-ADC result register is not updated, the A/D conversion termination interrupt is not generated, A/D conversion is not terminated automatically, and SARUN remains “1”.

26.2.8 SA-ADC Mode Register 0 (SADMOD0)

Address: 0F2F2H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
SADMOD0	—	—	—	—	—	—	SACH1	SACH0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

SADMOD0 is a special function register (SFR) used to choose A/D conversion channel(s).

[Description of Bits]

- **SACH0** (bit 0)

SACH0	Description
0	Stops conversion on channel 0. (Initial value)
1	Performs conversion on channel 0.

- **SACH1** (bit 1)

SACH1	Description
0	Stops conversion on channel 1. (Initial value)
1	Performs conversion on channel 1.

The SACH1 and SACH0 bits are used to select channel(s) on which A/D conversion is performed. If both channel 1 and channel 0 are set to “1”, A/D conversion is performed on channel 0 first, and then channel 1.

Depending on the combination of settings of this register and amplifier control register 0 (AMPCON0), the number of A/D conversion channels and the A/D conversion methods are varied.

See Section 26.3.2, Settings of A/D Conversion Channels.

Do not start A/D conversion both channel 1 and channel 0 set to 0. If conversion is started, the A/D conversion circuit is activated (ON), however, A/D conversion is not done. Therefore, the SA-ADC result register is not updated, A/D conversion termination interrupt does not occur, A/D conversion does not terminate automatically, and consequently, bit 0 (SARUN) of the SA-ADC control register (SADCON1) remains “1”.

26.2.9 Amplifier Offset Register (AMPOFFS)

Address: 0F2F4H
Access: R/W
Access size: 8 bits
Initial value: 03H

	7	6	5	4	3	2	1	0
AMPOFFS	—	—	—	AMPO4	AMPO3	AMPO2	AMPO1	AMPO0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	1	1

AMPOFFS is a special function register (SFR) used to select the amount of the input offset of the 2nd amplifier.

[Description of Bits]

- **AMPO4, AMPO3, AMPO2, AMPO1, AMPO0** (bits 4-0)

AMPO4	AMPO3	AMPO2	AMPO1	AMPO0	Description
0	0	0	0	0	Offset adjustment -1.5[%]
0	0	0	0	1	Offset adjustment -1.0[%]
0	0	0	1	0	Offset adjustment -0.5[%]
0	0	0	1	1	Offset adjustment 0[%] (Initial value)
0	0	1	0	0	Offset adjustment 0.5[%]
0	0	1	0	1	Offset adjustment 1.0[%]
0	0	1	1	0	Offset adjustment 1.5[%]
0	0	1	1	1	Offset adjustment 2.0[%]
0	1	0	0	0	Offset adjustment 2.5[%]
0	1	0	0	1	Offset adjustment 3.0[%]
0	1	0	1	0	Offset adjustment 3.5[%]
0	1	0	1	1	Offset adjustment 4.0[%]
0	1	1	0	0	Offset adjustment 4.5[%]
0	1	1	0	1	Offset adjustment 5.0[%]
0	1	1	1	0	Offset adjustment 5.5[%]
0	1	1	1	1	Offset adjustment 6.0[%]
1	0	0	0	0	Offset adjustment -9.5[%]
1	0	0	0	1	Offset adjustment -9.0[%]
1	0	0	1	0	Offset adjustment -8.5[%]
1	0	0	1	1	Offset adjustment -8.0[%]
1	0	1	0	0	Offset adjustment -7.5[%]
1	0	1	0	1	Offset adjustment -7.0[%]
1	0	1	1	0	Offset adjustment -6.5[%]
1	0	1	1	1	Offset adjustment -6.0[%]
1	1	0	0	0	Offset adjustment -5.5[%]
1	1	0	0	1	Offset adjustment -5.0[%]
1	1	0	1	0	Offset adjustment -4.5[%]
1	1	0	1	1	Offset adjustment -4.0[%]
1	1	1	0	0	Offset adjustment -3.5[%]
1	1	1	0	1	Offset adjustment -3.0[%]
1	1	1	1	0	Offset adjustment -2.5[%]
1	1	1	1	1	Offset adjustment -2.0[%]

26.2.10 Amplifier Gain Register (AMPGAIN)

Address: 0F2F5H
Access: R/W
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
AMPGAIN	—	—	—	—	AMPG3	AMPG2	AMPG1	AMPG0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

AMPGAIN is a special function register (SFR) used to select a gain (scaling factor) of the 2nd amplifier.

[Description of Bits]

- **AMPG3, AMPG2, AMPG1, AMPG0** (bits 3-0)

AMPG3	AMPG2	AMPG1	AMPG0	AMP gain	
				Amplification input	Differential amplification input
0	0	0	0	1 time (Initial value)	3 times (Initial value)
0	0	0	1	1.5 times	4.5 times
0	0	1	0	2 times	6 times
0	0	1	1	2.5 times	7.5 times
0	1	0	0	3 times	9 times
0	1	0	1	3.5 times	10.5 times
0	1	1	0	4 times	12 times
0	1	1	1	4.5 times	13.5 times
1	0	0	0	5 times	15 times
1	0	0	1	5.5 times	16.5 times
1	0	1	0	6 times	18 times
1	0	1	1	6.5 times	19.5 times
1	1	0	0	7 times	21 times
1	1	0	1	7.5 times	22.5 times
1	1	1	0	8 times	24 times
1	1	1	1	8.5 times	25.5 times

For the channel for which amplifier input is selected by the setting of amplifier control register 0 (AMPON0), the gain value is set according to the setting of AMPG3 to AMPG0 on the above table. The channel for which direct input is selected is not amplified.

For the channel for which differential amplification input is selected, the total gain is 3 times the gain for amplification input since the gain of the 1st amplifier is 3 times.

26.2.11 Amplifier Control Register 0 (AMPCON0)

Address: 0F2F6H
Access: R/W
Access size: 8/16 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
AMPCON0	—	—	—	—	—	AMPADJ	AMPEN1	AMPEN0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

AMPCON0 is a special function register used to control the 1st and 2nd amplifiers.

[Description of Bits]

• **AMPEN1,AMPEN0** (bits 1-0)

AMPEN1	AMPEN0	Configuration	A/D conversion input
0	0		Channel 0: Direct input Channel 1: Direct input (Initial value)
0	1		Channel 0: Direct input Channel 1: Amplification input
1	0		Channel 0: Amplification input Channel 1: Amplification input
1	1		Differential amplification input

Using AMPEN1 and AMPEN0, set the amplification of analog input signals by the 1st amplifier and the 2nd amplifier for input pins AIN0 and AIN1.

By using the 2nd amplifier, analog signals can be amplified and by using the 1st and 2nd amplifiers, differential amplification input is enabled through 2 pins, AIN0 and AIN2.

When neither AMPEN1 nor AMPEN0 is 0, the power is supplied to the amplifiers. When an amplifier is used, start A/D conversion after the amplifier has settled after powered on.

The direct input technique is suitable when amplification by the amplifier for analog input signals is not required in direct analog voltage conversion with SA-ADC.

- **AMPADJ0** (bit 2)

AMPADJ0	Description
0	No offset adjustment (Initial value)
1	Starts 1st amplifier offset adjustment

When AMPEN1 and AMPEN0 are set to “differential amplification input”, the input pins, AIN0 and AIN1, are shorted. That is, the offsets of the individual 1st amplifier and 2nd amplifier can be A/D converted by SA-ADC. When neither AMPEN1 nor AMPEN0 is set to “differential amplification input”, the function is disabled regardless of the setting of AMPADJ.

26.3 Description of Operation

26.3.1 Analog Input Settings

This LSI, which incorporates the 1st amplifier with differential input and the 2nd amplifier of the inversion structure with programmable gain and offset structure, enables A/D conversion according to the analog input signals by selecting the amplifier configuration according to the characteristics of the analog input signal.

An analog input setting is selectable from three types: direct input without using the amplifier, amplification input that amplifies the analog voltage, and differential amplification input that amplifies the voltage difference between the two pins.

In the following description, the A/D conversion range refers to the A/D conversion input range (AVREF to AVSS), the A/D conversion resolution refers to the change of the A/D conversion input value corresponding to the change of the A/D conversion result by 1, that is, the value produced by dividing the A/D conversion input range (AVREF to AVSS) by 4096 (12 bits), and the analog input change range refers to the range of analog input voltages which can change.

1. Direct input

If the A/D conversion resolution is enough as required when analog input signals are converted by direct A/D conversion and the A/D conversion result range for the analog input change range satisfies the requirement, select direct input. For the direct input settings, set bits 1 and 0 of the amplifier controller register 0 (AMPCON0) to 0.

Since the amplifier is not used, the amplifier settling time is not required.

In direct A/D conversion, the A/D conversion result increases when the input voltage increases.

2. Amplification input that amplifies analog voltages

If the resolution is insufficient in direct input, the 2nd amplifier can be used. The A/D conversion is performed after analog input signals are amplified.

To set channel 0 to "direct input" and channel 1 to "amplification input", set bits 1 and 0 of the amplifier control register 0 (AMPCON0) to 0 and 1. To set both channels 0 and 1 to "amplification input", set bits 1 and 0 of the amplifier control register 0 (AMPCON0) to 1 and 0.

The 2nd amplifier can amplify the gain within the range from 1 to 8.5 times by the setting of the amplification gain register (AMPGAIN). Through the setting of the amplification offset register (AMPOFFS), the offset can be adjusted within the range from -9.5% to 6.0%. Adjust the gain and offset so that the analog signal after amplification does not exceed the A/D conversion range. In amplification input, the amplification settling time is required.

As the 2nd amplifier applies the inversion amplifier configuration, the A/D conversion result decreases when the input voltage increases.

3. Differential amplification input that amplifies the voltage difference between the two pins

The output of the bridge configuration sensor, which is typical of a pressure sensor, is produced as a voltage difference between two pins.

To use the voltage difference between two pins as analog input, select differential amplification input.

For differential amplification input, set bits 1 and 0 of amplifier control register 0 (AMPCON0) to 1 and 1.

By using the 1st amplifier of the differential input configuration, the voltage difference of the two pins can be extracted.

The 1st amplifier has an amplification rate of 3 times.

By setting the gain through the amplifier gain register (AMPGAIN), analog signals can be amplified within the range from 1 to 8.5 times in the 2nd amplifier. Therefore, the total amplification rate of the amplifiers will be from 3 to 25.5 times. By setting the amplification offset register (AMPOFFS), the offset can be adjusted within the range from -9.5% to 6.0%. Adjust the gain and offset so that the analog signals after amplified do not exceed the A/D conversion range. For differential amplification input, the amplifier settling time is required.

As the 2nd amplifier applies the inversion amplifier configuration, the A/D conversion result decreases when the input voltage increases.

For differential amplification input, the offset voltage of the amplifier itself can be A/D converted.

The A/D conversion value eliminating offset can be obtained by subtracting the A/D conversion value of the offset voltage of the amplifier itself from the A/D conversion value of the differential input.

To perform A/D conversion of the offset voltage of the amplifier itself, set bit 2 (AMPADJ) of amplifier control register 0 (AMPCON0) to "1".

Figure 26-2 Amplifier Configurations

26.3.2 Settings of A/D Conversion Channels

A/D conversion for channels 0 and 1 for SA-ADC mode register 0 (SADM0D0) and the amplifier control register varies according to the combination.

When SA-ADC mode register 0 (SADM0D0) and the amplifier control register (AMP0CON0) is combined, A/D conversion is performed as shown below and A/D conversion results are stored in the SA-ADC result register.

SA-ADC mode register 0		SA-ADC result register	Channel 0: Direct input Channel 1: Direct input		Channel 0: Direct input Channel 1: Amplification input		Channel 0: Amplification input Channel 1: Amplification input		Differential amplification input	
			AMP EN1	AMP EN0	AMP EN1	AMP EN0	AMP EN1	AMP EN0	AMP EN1	AMP EN0
SACH0/1	0/1		0	0	0	1	1	0	1	1
SACH0	0	SADR0							AIN0 to 1 differential amplification input	
SACH1	1	SADR1								
SACH0	1	SADR0	AIN0 direct input		AIN0 direct input		AIN0 amplification input		AIN0 to 1 differential amplification input	
SACH1	0	SADR1								
SACH0	1	SADR0	AIN0 direct input*		AIN0 direct input		AIN0 amplification input*		AIN0 to 1 differential amplification input	
SACH1	1	SADR1	AIN1 direct input*							

The values of the result register for the sections with a slash mark remain unchanged.

Do not start A/D conversion when bits 1 (SACH1) and 0 (SACH0) of SA-ADC mode register 0 (SADM0D0) are 0 and 0. If A/D conversion is started, the A/D conversion circuit is set to ON. However, as A/D conversion is not performed, the SA-ADC result register is not updated, an A/D conversion termination interrupt is not generated, A/D conversion does not terminate automatically, and bit 0 (SARUN) of the SA-ADC control register (SAD0CON1) remains "1".

26.3.3 Operation of the Successive Approximation A/D Converter in Direct Input

For direct input, operate SA-ADC in the following procedure.

1. Before starting SA-ADC, start oscillation of the high-speed clock (HSCLK) and wait until the oscillator settles.
2. When HSCLK is within the range from 375kHz to 625kHz, set bit 1 (SACK) of the SA-ADC control register (SADCON0) to "0" and when HSCLK is within the range from 1.5MHz to 4.2MHz, set it to "1".
3. Set the amplifier control register (AMPCON0) and SA-ADC mode register 0 (SADMOD0).
4. When bit 0 (SARUN) of SA-ADC control register 1 (SADCON1) is set to "1", the SA-ADC circuit becomes active and performs A/D conversion from the lower channel number that is selected in the SA-ADC mode register (SADMOD0).
5. A/D conversion results are stored in the applicable SA-ADC result registers (SADRnL, SADRnH) and when A/D conversion of the largest channel number that is selected terminates, an SA-ADC conversion termination interrupt (ADSINT) is generated.
6. Finally, using bit 0 (SALP) of the SADCON0 register, it is possible to select whether A/D conversion is terminated (SARUN bit is "0") or A/D conversion is automatically restarted at termination of A/D conversion of the last channel.

Even if a channel is switched during A/D conversion, the channel that is selected at the start of A/D conversion is maintained until an A/D conversion termination interrupt occurs.

Figure 26-3 shows the SA-ADC operation timing when channel 0 and channel 1 are selected.

Figure 26-3 SA-ADC Operation Timing at Direct Input

Note:

A/D conversion time in 500kHzRC oscillation mode is 46 μs.

26.3.4 Operation of the Successive Approximation A/D Converter in Amplification Input

For amplification input, operate SA-ADC in the following procedure.

1. Before starting SA-ADC, start oscillation of the high-speed clock (HSCLK) and wait until the oscillator settles.
2. When HSCLK is within the range from 375kHz to 625kHz, set bit 1 (SACK) of the SA-ADC control register (SADCON0) to "0" and when HSCLK is within the range from 1.5MHz to 4.2MHz, set it to "1". Set bit 0 (SALP) to "0".
3. Set the amplifier control register (AMPCON0) and SA-ADC mode register 0 (SADMOD0).
4. Set amplifier offset register (AMPOFFS) and amplifier gain register (AMPGAIN).
5. When bit 0 (SARUN) of SA-ADC control register 1 (SADCON1) is set to "1" after the amplifier control register (AMPCON0) has been set and then the amplifier has been settled *, the SA-ADC circuit becomes active and performs A/D conversion from the lower channel number that is selected in the SA-ADC mode register (SADMOD0).
6. A/D conversion results are stored in the applicable SA-ADC result registers (SADRnL, SADRnH), and when A/D conversion terminates, the SA-ADC conversion termination interrupt is generated.
7. A/D conversion is stopped when the A/D conversion terminates, and bit 0 (SARUN) of SA-ADC control register 1 (SADCON1) is set to "0".

Even if a channel is switched during A/D conversion, the channel that is selected at the start of A/D conversion is maintained until an A/D conversion termination interrupt occurs.

Figure 26-4 shows the SA-ADC operation timing when channel 0 and channel 1 are selected.

Figure 26-4 SA-ADC Operation Timing at Amplification Input

* Amplifier settling time

The power-up time of the amplifier is 30 μs, the settling time of the amplifier after powered up is 54 μs, and the total time is 84 μs.

Power-up of the amplifier means that amplifier control registers AMPEN1 and AMPEN0 are set from "0" and "0" to "1" and "1" or to "1" and "0", respectively.

Notes:

Since the supply current is increased while the amplifier is powered up, set amplifier control registers AMPEN1 and AMPEN0 to "0" and "0" respectively to stop operating the amplifier if the amplifier is not used.

The A/D conversion time in 500 kHz RC oscillation mode is 46 μs.

26.3.5 Operation of the Successive Approximation A/D Converter in Differential Amplification Input

For differential amplification input, operate SA-ADC in the following procedure.

1. Before starting SA-ADC, start oscillation of the high-speed clock (HSCLK) and wait until the oscillator settles.
2. When HSCLK is within the range from 375KHz to 625kHz, set bit 1 (SACK) of the SA-ADC control register (SADCON0) to "0" and when HSCLK is within the range from 1.5MHz to 4.2MHz, set it to "1". Set bit 0 (SALP) to "0".
3. Set differential amplification input by setting bits 1 and 0 (AMPEN1 and AMPEN0) of amplifier control register 0 (AMPCON0) to "1" and "1" and set bits 1 and 0 (SACH1 and SACH0) of SA-ADC mode register 0 (SADMOD0) to "0" and "1".
4. Set amplifier offset register (AMPOFFS) and amplifier gain register (AMPGAIN).
5. When bit 0 (SARUN) of SA-ADC control register 1 (SADCON1) is set to "1" after the amplifier control register (AMPCON0) has been set and then the amplifier has been settled *, the SA-ADC circuit becomes active and starts A/D conversion.
6. A/D conversion results are stored in the SA-ADC result registers (SADR0L, SADR0H), and when A/D conversion terminates, the SA-ADC conversion termination interrupt is generated.
7. A/D conversion is stopped when the A/D conversion terminates, and bit 0 (SARUN) of SA-ADC control register 1 (SADCON1) is set to "0".

Even if a channel is switched during A/D conversion, the channel that is selected at the start of A/D conversion is maintained until an A/D conversion termination interrupt occurs.

Figure 26-5 shows the SA-ADC operation timing when channel 0 and channel 1 are selected.

Figure 26-5 SA-ADC Operation Timing at Differential Amplification Input

* Amplifier settling time

The power-up time of the amplifier is 30 µs, the settling time of the amplifier after powered up is 64 µs, and the total time is 94 µs.

Power-up of the amplifier means that amplifier control registers AMPEN1 and AMPEN0 are set from "0" and "0" to "1" and "1", respectively.

Notes:

Since the supply current is increased while the amplifier is powered up, set amplifier control registers AMPEN1 and AMPEN0 to "0" and "0" respectively to stop operating the amplifier if the amplifier is not used.

The A/D conversion time in 500 kHz RC oscillation mode is 46 µs.

Chapter 27

LCD Drivers

27. LCD Drivers

27.1 Overview

This LSI includes LCD drivers that display the contents that are set in the display register. The LCD drivers handle the LCD display functions with four blocks.

1. Display registers
2. Display allocation
3. Display control
4. Drivers

Figure 27-1 Configuration of LCD Display Function

The display registers are used to store the contents to be displayed as bit patterns.

The bit pattern storage method depends on the specification of the LCD panel to be used (display pattern and assignment of the COM pin and SEG pin) and the setting of the display allocation circuit.

The display allocation block controls mapping of the display register for the LCD common/segment.

Using the display allocation register A and B or not using them is selectable. When using them (Set DASN bit of DSPMOD1 register to "1"), the segment mapping of the display register can be specified in bit units by programming according to the contents of display allocation registers A and B. Therefore, the display register array can be changed in flexible and simplify the software process for display (This function is defined as the programmable display allocation function in the user's manual). Also, the data specified to the register A and B can be easily prepared by using LAPIS semiconductor LCD allocation Tool. Select type 3 for the display register segment map when using the programmable allocation function. The programmable display allocation function only generates table data can be used for the type 3. When not using the display allocation register A and B (Set DASN bit of DSPMOD1 register to "0"), select one of three types of display registers segment map and control the display with the display register only.

The display control circuit generates LCD drive waveforms according to the characteristics of the LCD.

A bias, a bias voltage multiplying clock, a duty, a frame frequency, and a contrast suitable for the LCD panel can be selected.

Note:

- The programmable display allocation function is available only when 1/1~1/8 duty is selected (when using eight COMs or less for display), it does not work when 1/9~1/24 duty is selected (when using nine COMs or more for display).
- Select type 3 for the display register segment map (Set DADM1 bit of DSPMOD1 register to "1") when using the programmable allocation function. LAPIS semiconductor LCD Tool only generates table data can be used for the type 3.
- When the programmable display function is not used (DASN = "0"), display allocation register A (0F400H to 0F5FFH) and display allocation register B (0F600H to 0F7FFH) can be used as 1K-byte data memory(RAM).

A) When not using Programmable display allocation function (DASN bit of DSPMOD1 register is "0")

Suitable for the dot matrix type LCD panel whose common/segment array is approximated to the bit array of the display register. One of three types for the display register segment mapping can be selected, the number of used COM pins determines the recommended type. See section 27.2.5, 27.2.9, and 27.3.2 for more detail.

When the programmable display function is not used, display allocation register A and display allocation register B (See section 27.2.7 and 27.2.8) can be used as 1K-byte data memory.

Figure 27-2 An example of correlation between display register and dot matrix type LCD

B) When using Programmable display allocation function (DASN bit of DSPMOD1 register is "1")

The programmable display allocation function is suitable for the LCD panel of segment type or character type whose common/segment array is restricted by the design or wiring. Segment mapping of the display register can be assigned in bit units by programming according to the contents of display allocation registers A and B. Therefore, the display register array can be changed in flexible and simplify the software process for display. Contents of the registers A(DSmCnA) specify addresses of the display registers (DSPR00 to FE) and contents of the registers B(DSmCnB) specify bits of the display registers, that are output to common "n" of segment "m".

Figure 27-3 An example of correlation between display registers and segment type LCD

27.1.1 Features

The LCD drivers are applicable to various types of LCD panels. The features include:

- ML610Q431: 1024 dots max. (64seg × 16com)
- ML610Q432: 1536 dots max. (64seg × 24com)
- 1/1 to 1/24 duty
- 1/3 and 1/4 bias (4 types)
- Frame frequency selectable (4 types)
- Bias voltage multiplying clock selectable (8 types)
- Contrast adjustment (1/3 bias:32 steps, 1/4 bias: 20 steps)
- Programmable display allocation function (available only when 1/1~1/8 duty is selected)

The programmable display allocation function facilitates software display processing.

By using “ALL LCDs on mode” and “ALL LCDs off mode”, LCD panel inspection processing software can be easily created.

27.1.2 Configuration of the LCD Drivers

Figure 27-4 shows the configuration of the LCD drivers and the bias generation circuit.

Figure 27-4 Configuration of LCD Drivers and Bias Generation Circuit

27.1.3 Configuration of the Bias Generation Circuit

The bias generation circuit generates LCD drive voltages (V_{L1} to V_{L4}) by multiplying the voltage (V_{L1}) generated by the voltage regulator with the capacitors (C_{12} and C_{34}).

When the BSON bit of the bias circuit control register (BIASCON) is set to "1", the bias generation circuit starts operation.

Display contrast adjustment is possible in 32 steps by using the display contrast register (DSPCNT).

Figure 27-5 shows the configurations of the bias generation circuit with 1/3 bias and with 1/4 bias.

Figure 27-5 Configuration of Bias Generation Circuit

Note:

When using 1/3 bias, connect the V_{L2} pin and the V_{L3} pin externally.

27.1.4 List of Pins

Pin name	I/O	Description
V _{L1}	—	Power supply pin for LCD bias (internally generated)

27.2 Description of Registers

27.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F0F0H	Bias circuit control register	BIASCON	—	R/W	8	08H
0F0F1H	Display contrast register	DSPCNT	—	R/W	8	00H
0F0F2H	Display mode register 0	DSPMOD0	DSPMOD	R/W	8/16	00H
0F0F3H	Display mode register 1	DSPMOD1		R/W	8	00H
0F0F4H	Display control register	DSPCON		R/W	8	00H
0F100H to 0F1FEH	Display register 00 to Display register FE	DSPR00 to DSPRFE	—	R/W	8	Undefined
0F400H to 0F5FFH	Display allocation register A	DS0C0A to DS63C7A	—	R/W	8	Undefined
0F600H to 0F7FFH	Display allocation register B	DS0C0B to DS63C7B	—	R/W	8	Undefined

27.2.2 Bias Circuit Control Register 0 (BIASCON)

Address: 0F0F0H

Access: R/W

Access size: 8 bits

Initial value: 08H

	7	6	5	4	3	2	1	0
BIASCON	—	—	—	BSEL	BSN2	BSN1	BSN0	BSON
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	1	0	0	0

BIASCON is a special function register (SFR) to control the bias generation circuit.

[Description of Bits]

- **BSON** (bit 0)

The BSON bit is used to control the operation of the bias generation circuit.

When BSON is set to “1”, the bias generation circuit generates the LCD drive voltages (VL1 to VL4).

BSON	Description
0	Bias circuit Off (initial value)
1	Bias circuit On

- **BSN2-BSN0** (bits 3-1)

The BSN2 to BSN0 bits are used to select a clock for multiplying the bias voltage in the bias generation circuit. LSCLK to 1/128LSCLK can be selected.

BSN2	BSN1	BSN0	Description
0	0	0	1/1 LSCLK (32 kHz)
0	0	1	1/2 LSCLK (16 kHz)
0	1	0	1/4 LSCLK (8 kHz)
0	1	1	1/8 LSCLK (4 kHz)
1	0	0	1/16 LSCLK (2 kHz) (initial value)
1	0	1	1/32 LSCLK (1 kHz)
1	1	0	1/64 LSCLK (512 Hz)
1	1	1	1/128 LSCLK (256 Hz)

- **BSEL** (bit 4)

The BSEL bit is used to set the bias in the bias generation circuit.

1/3 bias or 1/4 bias can be selected.

BSEL	Description
0	1/3 bias (initial value)
1	1/4 bias

27.2.3 Display Control Register (DSPCNT)

Address: 0F0F1H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
DSPCNT	—	—	—	LCN4	LCN3	LCN2	LCN1	LCN0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

DSPCNT is a special function register (SFR) to adjust the contrast of display (32 steps).

For the setting value of DSPCNT and the LCD drive voltages (V_{L1} , V_{L2} , V_{L3} , V_{L4}), see Appendix C, "Electrical Characteristics".

[Description of Bits]

- **LCN4-LCN0** (bits 4-0)

The LCN4 to LCN0 bits are used to adjust the contrast of display (32 steps).

LCN4	LCN3	LCN2	LCN1	LCN0	Description	V_{L1} voltage (typ.) V
0	0	0	0	0	Low	0.94 (initial value)
0	0	0	0	1	↑	0.96
0	0	0	1	0		0.98
0	0	0	1	1		1.00
0	0	1	0	0		1.02
0	0	1	0	1		1.04
0	0	1	1	0		1.06
0	0	1	1	1		1.08
0	1	0	0	0		1.10
0	1	0	0	1		1.12
0	1	0	1	0		1.14
0	1	0	1	1		1.16
0	1	1	0	0		1.18
0	1	1	0	1		1.20
0	1	1	1	0		1.22
0	1	1	1	1		1.24
1	0	0	0	0		1.26
1	0	0	0	1		1.28
1	0	0	1	0		1.30
1	0	0	1	1		1.32
1	0	1	0	0		1.34
1	0	1	0	1		1.36
1	0	1	1	0		1.38
1	0	1	1	1		1.40
1	1	0	0	0		1.42
1	1	0	0	1		1.44
1	1	0	1	0		1.46
1	1	0	1	1		1.48
1	1	1	0	0		1.50
1	1	1	0	1		1.52
1	1	1	1	0	↓	1.54
1	1	1	1	1	High	1.56

Note: Only the 20-step adjustment is usable when 1/4 bias is selected (when the BSEL bit of the BIASCON register is "1").

27.2.4 Display Mode Register 0 (DSPMOD0)

Address: 0F0F2H

Access: R/W

Access size: 8/16 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
DSPMOD0	—	FRM1	FRM0	DUTY4	DUTY3	DUTY2	DUTY1	DUTY0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

DSPMOD0 is a special function register (SFR) to control the display mode of the LCD drivers.

[Description of Bits]

- **DUTY4-DUTY0** (bits 4-0)

The DUTY4 to DUTY0 bits are used to specify the duty in 24 steps (1/1 to 1/24).

DUTY4	DUTY3	DUTY2	DUTY1	DUTY0	Description
0	0	0	0	0	1/1 duty (initial value)

- **FRM1-FRM0** (bits 6-5)

The FRM1 to FRM0 bits are used to select a frame frequency of the LCD drivers.

The reference frequency of a frame frequency (LLSCLK = 32.768 kHz) is selectable from 64 Hz, 73 Hz, 85 Hz, or 102 Hz.

FRM1	FRM0	Description
0	0	Reference frequency: 64 Hz (initial value)
0	1	Reference frequency: 73 Hz
1	0	Reference frequency: 85 Hz
1	1	Reference frequency: 102 Hz

The frame frequency for each duty is listed in Table 27-1.

Table 27-1 Frame Frequency for Each Duty

Duty	Frame frequency [Hz]			
	Reference frequency 64Hz	Reference frequency 73Hz	Reference frequency 85Hz	Reference frequency 102Hz
1/1 duty	64.00	73.14	85.33	102.40
1/2 duty	64.00	73.14	85.33	102.40
1/3 duty	64.25	73.31	85.33	103.04
1/4 duty	64.00	73.14	85.33	102.40
1/5 duty	64.25	73.64	86.23	102.40
1/6 duty	64.25	73.80	85.33	103.04
1/7 duty	64.13	73.14	86.69	104.03
1/8 duty	64.00	73.14	85.33	102.40
1/9 duty	86.69	98.40	113.78	140.03
1/10 duty	78.02	88.56	102.40	126.03
1/11 duty	70.93	80.51	93.09	114.57
1/12 duty	65.02	73.80	85.33	105.03
1/13 duty	78.77	90.02	105.03	126.03
1/14 duty	73.14	83.59	97.52	117.03
1/15 duty	68.27	78.02	91.02	109.23
1/16 duty	64.00	73.14	85.33	102.40
1/17 duty	77.10	87.61	101.45	120.47
1/18 duty	72.82	82.75	95.81	113.78
1/19 duty	68.99	78.39	90.77	107.79
1/20 duty	65.54	74.47	86.23	102.40
1/21 duty	74.30	86.69	97.52	120.03
1/22 duty	70.93	82.75	93.09	114.57
1/23 duty	67.84	79.15	89.04	109.59
1/24 duty	65.02	75.85	85.33	105.03

27.2.5 Display Mode Register 1 (DSPMOD1)

Address: 0F0F3H
Access: R/W
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
DSPMOD1	—	—	—	—	—	DASN	DADM1	DADM0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

DSPMOD1 is a special register (SFR) to control the display mode of the LCD drivers.

Use DSPMOD1 to select a type of display register segment map and determine to use or unuse the programmable display allocation function (display allocation RAM).

[Description of Bits]

- DADM1, DADM0 (bits 1-0)

DADM1 and DADM0 are used to select a type of display register segment map. Three types are available; type 1, type 2, and type 3. See section 27.2.9 and section 27.3.2.

DADM1	DADM0	Description
0	0	Display register segment map type 1 (initial value)
0	1	Display register segment map type 2
1	*	Display register segment map type 3

- DASN (bit 2)

The DASN bit is used to control the operation of the display allocation function. Setting the DASN bit to “1” enables the display allocation function.

DASN	Description
0	Not use Programmable display allocation (initial value)
1	Use Programmable display allocation

Note:

When using the programmable display allocation, select type 3 for the display register segment map. LAPIS semiconductor LCD Tool only generates table data can be used for the type 3.

27.2.6 Display Control Register (DSPCON)

Address: 0F0F4H
Access: R/W
Access size: 8 bits
Initial value: 00H

	7	6	5	4	3	2	1	0
DSPCON	—	—	—	—	—	—	LMD1	LMD0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

DSPCON is a special function register (SFR) to control the LCD drivers.

[Description of Bits]

- **LMD1-LMD0** (bits 1, 0)

The LMD1 and LMD0 bits are used to select an LCD display mode.

LCD stop mode, all LCDs off mode, LCD display mode, and all LCDs on mode can be selected.

In LCD stop mode, V_{ss} level is output to all the common drivers and segment drivers. The charge and discharge current to and from the display panel can be stopped.

In all LCDs off mode, off waveform is output to all the segment drivers irrespective of the contents of the display registers.

In LCD display mode, the contents of the display registers are output to each segment driver.

In all LCDs on mode, on waveform is output to all the segment drivers irrespective of the contents of the display registers.

LMD1	LMD0	Description
0	0	LCD stop mode (initial value)
0	1	All LCDs off mode
1	0	LCD display mode
1	1	All LCDs on mode

27.2.7 Display Allocation Register A (DS0C0A to DS63C7A)

Address: 0F400H to 0F5FFH

Access: R/W

Access size: 8 bits

Initial value: Undefined

	7	6	5	4	3	2	1	0
D _{SmCnA}	a7	a6	a5	a4	a3	a2	a1	a0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	x	x	x	x	x	x	x	x

D_{SmCnA} (m= 0 to 63, n = 0 to 7) are special function registers (SFRs) that are used for the programmable display allocation function.

Each valid bit of D_{SmCnA} becomes undefined at system reset.

When the programmable display allocation function is not used (DASN bit of DSPMOD1 register is reset to "0"), D_{SmCnA} can be used as data memory space (512-byte RAM).

Table 27-2 shows a list of the display allocation register A.

[Description of Bits]

- **a7-a0** (bits 7-0)

The a7 to a0 bits of D_{SmCnA} (m= 0 to 63, n = 0 to 7) are used to select the lower 8 bits of the addresses of the display registers (DSPR00 to FE) that are output to common n of segment m.

Set D_{SmCnA} when the DASN bit of the display mode register 1 (DSPMOD1) is "0".

When the DASN bit is "1", access from the CPU is invalid.

Table 27-2 Display Allocation Register A

27.2.8 Display Allocation Register B (DS0C0B to DS63C7B)

Address: 0F600H to 0F7FFH

Access: R/W

Access size: 8 bits

Initial value: Undefined

	7	6	5	4	3	2	1	0
D _{SmCnB}	b7	b6	b5	b4	b3	b2	b1	b0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	x	x	x	x	x	x	x	x

D_{SmCnB} (m= 0 to 63, n = 0 to 7) are special function registers (SFRs) to store segment allocation data.

Each valid bit of D_{SmCnB} becomes undefined at system reset.

When the programmable display allocation function is not used (DASN bit of DSPMOD1 register is reset to "0"), D_{SmCnB} can be used as data memory space (512-byte RAM).

Table 27-3 shows a list of display allocation register B.

[Description of Bits]

- **b2-b0** (bits 2-0)

The b2 to b0 bits of D_{SmCnB} (m= 0 to 63, n = 0 to 7) are used to set the bits of the display registers (DS_{PR00} to FE) that are output to common n of segment m.

Set D_{SmCnB} when the DASN bit of the display control register 0 (DSPCON0) is "0".

When the DASN bit is "1", access from the CPU is invalid.

b2	b1	b0	Description
0	0	0	Selects bit 0
0	0	1	Selects bit 1
0	1	0	Selects bit 2
0	1	1	Selects bit 3
1	0	0	Selects bit 4
1	0	1	Selects bit 5
1	1	0	Selects bit 6
1	1	1	Selects bit 7

27.2.9 Display Registers (DSPR00 to DSPRFE)

Address: 0F100H to 0F1FEH

Access: R/W

Access size: 8 bits

Initial value: Undefined

	7	6	5	4	3	2	1	0
DSPRxx	c23/15/7	c22/14/6	c21/13/5	c20/12/4	c19/11/3	c18/10/2	c17/9/1	c16/8/0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	x	x	x	x	x	x	x	x

DSPRxx (xx = 00 to FF) are special function registers (SFRs) to store display data.

Each valid bit of DSPRxx becomes undefined at system reset.

The display registers that are not used for LCD display can be used for data memories.

Set data in DSPRxx before setting LCD display mode.

Tables 27-4 to 27-6 list display registers segment map type 1 to type 3 respectively. The type can be selected by the DADM1 and DADM0 bits of the display mode register 1 (DSPMOD1).

[Description of Bits]

- **c23-c0** (bits 7-0)

The c23 to c0 bits are used to set display data.

c23 to c0	Description
0	off waveform
1	on waveform

27.3 Description of Operation

27.3.1 Operation of LCD Drivers and Bias Generation Circuit

Figure 27-6 shows the operation of the LCD drivers and the bias generation circuit.

Figure 27-6 Operation of LCD Drivers and Bias Generation Circuit

- ① System reset causes the bias generation circuit and the LCD drivers to stop operation and V_{SS} level to be output to each of the common and segment pins.
 - ② By using the bias circuit control register (BIASCON), select 1/3 bias or 1/4 bias and lock of bias voltage multiplying, and set the bias generation circuit to on (BSON = "1").
 - ③ When the programmable display allocation function is used, set LCD allocation data in the display allocation registers A and B (DS0C0A to DS63C7A and DS0C0B to DS63C7B).
 - ④ Set a frame frequency and a duty by using the display mode register 0 (DSPMOD0). When using the programmable display allocation function, set the DASN bit of DSPMOD1 register to "1" and set DADM1 bit to "1" to select type 3 for the display register segment map. When not using the programmable display allocation function, set the DASN bit to "0" and select a type of segment map for display registers.
 - ⑤ Set display data in the display registers (DSPR00 to DSPRFE).
 - ⑥ After elapse of the bias activation time (T_{BIAS}) or longer, set the mode to display mode by using the LMD1 and LMD0 bits of the display control register (DSPCON). (Display waveform is output to each segment pin.)
- For the bias activation time (T_{BIAS}), see the "Electrical Characteristics" Section in Appendix C.

27.3.2 Segment Mapping When the Programmable Display Allocation Function is Not Used

When not using the programmable display function (DASN bit of DSPMOD1 register is "0"), three types of segment map are available for the display registers (DSPR00 to FE), selected by the DADM1 bit and DADM0 bit.

(1) Type 1: Recommended for when using COM16 to COM23 (1/17 to 1/24 duty)

(2) Type 2: Recommended for when using COM9 to COM15 (1/9 to 1/16 duty)

(3) Type 3: Recommended for when using COM0 to COM7 (1/1 to 1/8 duty)

Figure 27-7 Configurations of Display register segment map types

Note:

When the programmable display function is not used (DASN = "0"), display allocation register A (0F400H to 0F5FFH) and display allocation register B (0F600H to 0F7FFH) can be used as 1K-byte data memory(RAM).

27.3.3 Segment Mapping When the Programmable Display Allocation Function is Used

When the programmable display allocation function is used (DASN bit of DSPMOD1 register is "1"), display registers (DSPR00 to FE) segment mapping can be set in bit units according to the contents of display allocation registers A and B (DSmCnA, DSmCnB: m = 0 to 63, n = 0 to 7).

Table 27-7 shows the frame frequencies and the duty conditions that allow the use of the programmable allocation function.

Table 27-7 Conditions That Allow the Use of Programmable Allocation Function

Frame frequency	Duty that allows the use of duty
Approx. 64 Hz	1/1 to 1/8 Duty
Approx. 73 Hz	1/1 to 1/7 Duty
Approx. 85 Hz	1/1 to 1/6 Duty
Approx. 102 Hz	1/1 to 1/5 Duty

Note:

- When the duty is other than those indicated in Table 27-7, the programmable allocation function can not be used regardless of the content of the DASN bit of DSPMOD1. The programmable display allocation function is available only when 1/1~1/8 duty is selected (when using eight COMs or less for display), it does not work when 1/9~1/24 duty is selected (when using nine COMs or more for display).
- Select type 3 for the display register segment map (Set DADM1 bit of DSPMOD1 register to "1") when using the programmable allocation function.

Figure 27-8 shows the configuration when using the programmable display allocation function.

Figure 27-8 Configuration When Using the Programmable Display Allocation Function

In display allocation register A (DSmCnA: m = 0 to 63, n = 0 to 8), set the lower 8 bits (00H to 0FEH) of the addresses of the display registers (DSPR00 to DSPRFE) that are output to common n of segment n. In display allocation register B (DSmCnB: m = 0 to 63, n = 0 to 8), set the bits of the display registers (DSPR00 to DSPRFE) that are output to common n of segment m.

For instance, to display bit 6 of display register 23 to common 3 of segment 16, set as follows.

Note:

- Set display allocation data to display allocation registers A and B when the DASN bit of display control register 0 (DSPMOD1) is "0". When the DASN bit is "1", access from the CPU is invalid.
- Select type 3 for the display register segment map (Set DADM1 bit of DSPMOD1 register to "1") when using the programmable allocation function.

27.3.4 Common Output Waveforms

Figure 27-9 shows the common output waveforms for 1/8 duty and 1/3 bias and for 1/24 duty and 1/4 bias.

Figure 27-9 (1) Common Output Waveforms for 1/8 Duty and 1/3 Bias

Figure 27-9 (2) Common Output Waveforms for 1/8 Duty and 1/3 Bias

27.3.5 Segment Output Waveform

Figure 27-5 shows the segment output waveforms for 1/8 duty and 1/3 bias and for 1/24 duty and 1/4 bias.

Figure 27-10 (1) Segment Output Waveforms for 1/8 Duty and 1/3 Bias

Figure 27-10 (2) Segment Output Waveforms for 1/24 Duty and 1/4 Bias

Battery Level Detector

28. Battery Level Detector

28.1 Overview

This LSI includes a Battery Level Detector (BLD).

16 levels of threshold voltages can be selected by setting Battery Level Detector control register 0 (BLDCON0).

28.1.1 Features

- Threshold voltages: One out of the 16 levels can be selected
- Accuracy: $\pm 2\%$ (Typ.)
- Temperature deviation: $0\%/^{\circ}\text{C}$ (Typ)

28.1.2 Configuration

BLD consists of the comparator and threshold voltage select circuits.

Figure 28-1 shows the configuration of the Battery Level Detector.

BLDCON0 : Battery Level Detector control register 0

BLDCON1 : Battery Level Detector control register 1

Figure 28-1 Configuration of Battery Level Detector

28.2 Description of Registers

28.2.1 List of Registers

Address	Name	Symbol (Byte)	Symbol (Word)	R/W	Size	Initial value
0F0D0H	Battery Level Detector control register 0	BLDCON0	BLDCON	R/W	8/16	00H
0F0D1H	Battery Level Detector control register 1	BLDCON1		R/W	8	00H

28.2.2 Battery Level Detector Control Register 0 (BLDCON0)

Address: 0F0D0H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
BLDCON0	—	—	—	—	LD3	LD2	LD1	LD0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Initial value	0	0	0	0	0	0	0	0

BLDCON0 is a special function register (SFR) to control the Battery Level Detector

[Description of Bits]

- **LD3, LD2, LD1, LD0** (bits 3-0)

The LD3, LD2, LD1, and LD0 bits are used to select a threshold voltage (VCMP) of the Battery Level Detector. 16 levels of threshold voltages can be selected.

LD3	LD2	LD1	LD0	Description
0	0	0	0	1.35 V $\pm 2\%$ (initial value)
0	0	0	1	1.40 V $\pm 2\%$
0	0	1	0	1.45 V $\pm 2\%$
0	0	1	1	1.50 V $\pm 2\%$
0	1	0	0	1.60 V $\pm 2\%$
0	1	0	1	1.70 V $\pm 2\%$
0	1	1	0	1.80 V $\pm 2\%$
0	1	1	1	1.90 V $\pm 2\%$
1	0	0	0	2.00 V $\pm 2\%$
1	0	0	1	2.10 V $\pm 2\%$
1	0	1	0	2.20 V $\pm 2\%$
1	0	1	1	2.30 V $\pm 2\%$
1	1	0	0	2.40 V $\pm 2\%$
1	1	0	1	2.50 V $\pm 2\%$
1	1	1	0	2.70 V $\pm 2\%$
1	1	1	1	2.90 V $\pm 2\%$

28.2.3 Battery Level Detector Control Register 1 (BLDCON1)

Address: 0F0D1H

Access: R/W

Access size: 8 bits

Initial value: 00H

	7	6	5	4	3	2	1	0
BLDCON1	—	—	—	—	—	—	BLDF	ENBL
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W
Initial value	0	0	0	0	0	0	0	0

BLDCON1 is a special function register (SFR) to control the Battery Level Detector.

[Description of Bits]

- **ENBL** (bit 0)

The ENBL bit is used to control activation (ON) or deactivation (OFF) of the Battery Level Detector.

The Battery Level Detector is activated (ON) and deactivated (OFF) by setting the ENBL bit to “1” and “0”, respectively.

ENBL	Description
0	Deactivates the Battery Level Detector (OFF) (initial value)
1	Activates the Battery Level Detector (ON).

- **BLDF** (bit 1)

The BLDF bit is the judgment result flag of the Battery Level Detector.

The BLDF bit is set to “1” or “0” when the power supply voltage (VDD) is lower than or higher than the threshold voltage selected by LD3 to LD0 bits of BLDCON0 register, respectively.

BLDF	Description
0	Higher than the threshold voltage (initial value)
1	Lower than the threshold voltage

28.3 Description of Operation

28.3.1 Threshold Voltage

The threshold voltage (VCMP) is selected by setting the bits of BLDCON0.

Table 28-1 shows the threshold voltages and the accuracy.

Table 28-1 Threshold Voltages and Accuracy

BLDCON0				Threshold voltage V _{CMP}	Accuracy Ta = 25°C
LD3	LD2	LD1	LD0		
0	0	0	0	1.35 V	±2.0%
0	0	0	1	1.40 V	
0	0	1	0	1.45 V	
0	0	1	1	1.50 V	
0	1	0	0	1.60 V	
0	1	0	1	1.70 V	
0	1	1	0	1.80 V	
0	1	1	1	1.90 V	
1	0	0	0	2.00 V	
1	0	0	1	2.10 V	
1	0	1	0	2.20 V	
1	0	1	1	2.30 V	
1	1	0	0	2.40 V	
1	1	0	1	2.50 V	
1	1	1	0	2.70 V	
1	1	1	1	2.90 V	

28.3.2 Operation of Battery Level Detector

Activation (ON) and deactivation (OFF) of the Battery Level Detector are controlled by setting the ENBL bit of the Battery Level Detector control register (BLDCON1), and the result of the comparison of the power supply voltage (VDD) to the threshold voltage is output to the BLDF bit of BLDCON1.

When ENBL, the enable control bit of the Battery Level Detector, is set to "1", the detector is activated (ON). When ENBL is set to "0", the detector is deactivated (OFF) and has no supply current.

BLDF indicates the result of comparison. When BLDF bit is set to "1", it indicates the power supply voltage is lower than the threshold voltage. When BLDF bit is set to "0", it indicates the power supply voltage (VDD) is higher than the threshold voltage. The Battery Level Detector requires a settling time. Read BLDF bit 1ms or more after ENBL bit is set to "1".

Figure 28-2 shows an example of the operation timing diagram.

Figure 28-2 Example of Operation Timing Diagram

The operations in Figure 28-2 are described below.

- ① The Battery Level Detector is activated (ON) by setting the ENBL bit to "1".
- ② Wait the settling time (min. 1 ms) of the Battery Level Detector.
- ③ Read BLDF bit.
- ④ Set ENBL bit to "0".

Note:

Select the threshold voltage (V_{CMP}) when the ENBL bit is "0".

Power Supply Circuit

29. Power Supply Circuit

29.1 Overview

This LSI includes a regulated power supply for the internal logic (VRL) and a regulated power supply for low-speed oscillation (VRX).

The VRL outputs the operating voltage, V_{DDL} , of the internal logic, program memory, RAM, etc.

The VRX outputs the operating voltage, V_{DDX} , for low-speed oscillation.

For the circuit configuration of the power supplies (AVDD, AVSS) for the analog circuits, see Chapter 26, "Successive Approximation Type A/D converter".

For the circuit configuration of the power supplies for LCD (VL1 to VL4), see Chapter 27, "LCD Driver".

29.1.1 Features

- VRL outputs the operating voltage, V_{DDL} , of the internal logic, program memory, RAM, etc.
- VRX outputs the operating voltage, V_{DDX} , for low-speed oscillation.

29.1.2 Configuration

Figure 29-1 shows the configuration of the power supply circuit.

*: Shows the secondary function of the port.

Figure 29-1 Configuration of Power Supply Circuit

29.1.3 List of Pins

Pin name	I/O	Description
V_{DDL}	—	Positive power supply pin for the internal logic circuits
V_{DDX}	—	Positive power supply pin for low-speed oscillation

29.2 Description of Operation

V_{DDL} and V_{DDX} become approx. 1.2 V at a system reset.

V_{DDL} becomes approx. 1.65 V (Typ.) when high-speed oscillation starts in crystal/ceramic oscillation mode or PLL oscillation mode or external clock mode. When high-speed oscillation stops, the voltage becomes about 1.2V (Typ.).

V_{DDX} becomes approx. 0.6 V (Typ.) after 4096 low-speed oscillation clock (XTCLK) pulses are counted after the system reset is released. As a result of release of STOP mode (generation of external interrupt), V_{DDX} becomes approx. 1.2 V (Typ.) and then approx. 0.6 V (Typ.) after 4096 low-speed oscillation clock (XTCLK) pulses are counted. Figure 29-2 shows the operation waveforms of the power supply circuit.

*1: Crystal/ceramic oscillation, PLL oscillation, External clock input mode (500 kHz CR oscillation not included)

Figure 29-2 Operation Waveforms of Power Supply Circuit

On-Chip Debug Function

30. On-Chip Debug Function

30.1 Overview

This LSI has an on-chip debug function allowing Flash memory rewriting.
The on-chip debug emulator (uEASE) is connected to this LSI to perform the on-chip debug function.

30.2 Method of Connecting to On-Chip Debug Emulator

Figure 30-1 shows connection to the on-chip debug emulator (uEASE).
For on-chip debug emulator, see “uEASE User's Manual”.

Figure 30-1 Connection to On-chip Debug Emulator (uEASE)

Note:

- Please do not apply LSIs used for debugging to mass production.
- When using the on-chip debug function or the flash rewrite function after mounting of the board, design the board so that the 6 pins (V_{PP}, V_{DD}, V_{DDL}, V_{SS}, RESET_N, and TEST_N) required for connection to the on-chip debug emulator can be connected.
- “3.0V to 3.6V” has to be supplied to VDD while debugging and writing flash.
- When the system reset circuit is included in the user application circuit, enable switching of the connection in the user application circuit, as shown above. When the system reset circuit is not included in the user application circuit, the RESET_N pin can be connected directly to the RESET_N pin of this LSI.

For details, see “uEASE User's Manual” and “uEASE Target Connection Manual”.

30.3 Flash Memory Rewrite Function

Flash memory erase/write can be performed with the the memory mounted on board by using the commands from the on-chip debug emulator (uEASE). For more details on the on-chip debug emulator, see "uEASE User's Manual". Table 30-2 shows the Flash memory rewrite functions.

Table 30-2 Flash Memory Rewrite Functions

Function	Outline
Chip erase	Erase of 32 Kwords (overall area)
Block erase	Erase of 8 Kwords (16 Kbytes)
1-word write	Write of 1 word (2 bytes)
Random read	Read of input address

Table 30-3 shows the conditions and specifications of Flash memory rewrite.

Table 30-3 Specifications of Flash Memory Rewrite

Parameter		Specifications
Rewrite count		80
Operating temperature		0°C to 40°C
Operating voltage	V _{PP}	8 V (Typ.) (Supplied from uEASE)
	V _{DD}	3.0V to 3.6 V
	V _{DDL}	2.7 V (Typ.) (Supplied from uEASE)
Chip-erase time		77 ms (Typ.), 100 ms (Max.)
Block-erase time		77 ms (Typ.), 100 ms (Max.)
1-word (16 bits) write		41 μs (Typ.), 64 μs (Max.)
Overall-word (32K × 16 bits) write		Approx. 1.35s (Typ.), Approx. 2.1s (Max.)

Note:

When performing Flash memory rewrite (erase, write), a voltage within the range from 3.0V to 3.6 V needs to be applied to the power supply voltage V_{DD}.

Appendix B Package Dimensions

(Unit: mm)

Notes for Mounting the Surface Mount Type Package

The surface mount type packages are very susceptible to heat in reflow mounting and humidity absorbed in storage. Therefore, before you perform reflow mounting, contact our responsible sales person for the product name, package name, pin number, package code and desired mounting conditions (reflow method, temperature and times).

Appendix C Electrical Characteristics

● Absolute Maximum Ratings

($V_{SS} = AV_{SS} = 0V$)

Parameter	Symbol	Condition	Rating	Unit
Power supply voltage 1	V_{DD}	$T_a = 25^{\circ}C$	-0.3 to +4.6	V
Power supply voltage 2	AV_{DD}	$T_a = 25^{\circ}C$	-0.3 to +4.6	V
Power supply voltage 3	V_{PP}	$T_a = 25^{\circ}C$	-0.3 to +9.5	V
Power supply voltage 4	V_{DDL}	$T_a = 25^{\circ}C$	-0.3 to +3.6	V
Power supply voltage 5	V_{DDX}	$T_a = 25^{\circ}C$	-0.3 to +3.6	V
Power supply voltage 6	V_{L1}	$T_a = 25^{\circ}C$	-0.3 to +1.75	V
Power supply voltage 7	V_{L2}	$T_a = 25^{\circ}C$	-0.3 to +3.5	V
Power supply voltage 8	V_{L3}	$T_a = 25^{\circ}C$	-0.3 to +5.25	V
Power supply voltage 9	V_{L4}	$T_a = 25^{\circ}C$	-0.3 to +7.0	V
Input voltage	V_{IN}	$T_a = 25^{\circ}C$	-0.3 to $V_{DD}+0.3$	V
Output voltage	V_{OUT}	$T_a = 25^{\circ}C$	-0.3 to $V_{DD}+0.3$	V
Output current 1	I_{OUT1}	Port3-A, $T_a = 25^{\circ}C$	-12 to +11	mA
Output current 2	I_{OUT2}	Port2, $T_a = 25^{\circ}C$	-12 to +20	mA
Power dissipation	PD	$T_a = 25^{\circ}C$	122	mW
Storage temperature	T_{STG}	—	-55 to +150	$^{\circ}C$

● Recommended Operating Conditions

($V_{SS} = AV_{SS} = 0V$)

Parameter	Symbol	Condition	Range	Unit
Operating temperature	T_{OP}	—	-20 to +70	$^{\circ}C$
Operating voltage	V_{DD}	—	1.1 to 3.6	V
	AV_{DD}	—	2.2 to 3.6	
Operating frequency (CPU)	f_{OP}	$V_{DD} = 1.1$ to $3.6V$	30k to 36k	Hz
		$V_{DD} = 1.3$ to $3.6V$	30k to 650k	
		$V_{DD} = 1.8$ to $3.6V$	30k to 4.2M	
Low-speed crystal oscillation frequency	f_{XTL}	—	32.768k	Hz
Low-speed crystal oscillation external capacitor	C_{DL}	—	0 to 12	pF
	C_{GL}	—	0 to 12	
High-speed crystal/ceramic oscillation frequency	f_{XTH}	—	4.0M / 4.096M	Hz
High-speed crystal oscillation external capacitor	C_{DH}	—	24	pF
	C_{GH}	—	24	
Capacitor externally connected to V_{DDL} pin	C_{L0}	—	1.0±30%	μF
	C_{L1}	—	0.1±30%	
Capacitor externally connected to V_{DDX} pin	C_X	—	0.1±30%	μF
Capacitors externally connected to $V_{L1, 2, 3, 4}$ pins	$C_{a, b, c, d}$	—	1.0±30%	μF
Capacitors externally connected across C1 and C2 pins and across C3 and C4 pins	$C_{12, C34}$	—	1.0±30%	μF

● Operating Conditions of Flash Memory

($V_{SS} = AV_{SS} = 0V$)

Parameter	Symbol	Condition	Range	Unit
Operating temperature	T_{OP}	At write/erase ^{*1}	0 to +40	°C
Operating voltage	V_{DD}	At write/erase ^{*1}	2.75 to 3.6	V
	V_{DDL}	At write/erase ^{*1}	2.5 to 2.75	
	V_{PP}	At write/erase ^{*1}	7.7 to 8.3	
Write cycles	C_{EP}	—	80	cycles
Data retention	Y_{DR}	—	10	years

^{*1}: When writing to and erasing on the flash Memory, the voltage in the specified range needs to be supplied to the V_{DDL} pin.
The V_{PP} pin has an internal pull-down resistor.

● DC Characteristics (1/5)

($V_{DD} = 1.1$ to $3.6V$, $AV_{DD} = 2.2$ to $3.6V$, $V_{SS} = AV_{SS} = 0V$, $T_a = -20$ to $+70^{\circ}C$, unless otherwise specified) (1/5)

Parameter	Symbol	Condition		Rating			Unit	Measuring circuit
				Min.	Typ.	Max.		
500kHz RC oscillation frequency	f _{RC}	V _{DD} = 1.3 to 3.6V	Ta = 25°C	Typ. -10%	500	Typ. +10%	kHz	1
			Ta = -20 to +70°C	Typ. -25%	500	Typ. +25%	kHz	
PLL oscillation frequency* ⁴	f _{PLL}	LSCLK = 32.768kHz V _{DD} = 1.8 to 3.6V		Typ. -2.5%	8.192	Typ. +2.5%	MHz	
Low-speed crystal oscillation start time* ²	T _{XTL}	—		—	0.3	2	s	
500kHz RC oscillation start time	T _{RC}	—		—	50	500	μs	
High-speed crystal oscillation start time* ³	T _{XTH}	V _{DD} = 1.8 to 3.6V		—	2	20	ms	
PLL oscillation start time	T _{PLL}	V _{DD} = 1.8 to 3.6V		—	1	10		
Low-speed oscillation stop detect time* ¹	T _{STOP}	—		0.2	3	20	μs	
Reset pulse width	P _{RST}	—		200	—	—		
Reset noise elimination pulse width	P _{NRST}	—		—	—	0.3		
Power-on reset activation power rise time	T _{POR}	—		—	—	10	ms	

^{*1}: When low-speed crystal oscillation stops for a duration more than the low-speed oscillation stop detect time, the system is reset to shift to system reset mode.

^{*2}: Use 32.768KHz Crystal Oscillator C-001R (Epson Toyocom) with capacitance $C_{GL}/C_{DL} = 0pF$.

^{*3}: Use 4.096MHz Crystal Oscillator HC49SFWB (Kyocera).

^{*4}: 1024 clock average.

● RESET

● DC Characteristics (2/5)

($V_{DD} = 1.1$ to $3.6V$, $AV_{DD} = 2.2$ to $3.6V$, $V_{SS} = AV_{SS} = 0V$, $T_a = -20$ to $+70^\circ C$, unless otherwise specified) (2/5)

*1: Kfx is the ratio of the oscillation frequency by the sensor resistor to the oscillation frequency by the reference resistor on the same conditions.

$$Kfx = \frac{f_{OSCx}(RT0-CS0 \text{ oscillation})}{f_{OSCx}(RS0-CS0 \text{ oscillation})}, \frac{f_{OSCx}(RT0-1-CS0 \text{ oscillation})}{f_{OSCx}(RS0-CS0 \text{ oscillation})}, \frac{f_{OSCx}(RT1-CS1 \text{ oscillation})}{f_{OSCx}(RS1-CS1 \text{ oscillation})}$$

(x = 1, 2, 3)

Note:

- Please have the shortest layout for the common node (wiring patterns which are connected to the external capacitors, resistors and IN0/IN1 pin), including CVR0/CVR1. Especially, do not have long wire between IN0/IN1 and RS0/RS1. The coupling capacitance on the wires may occur incorrect A/D conversion. Also, please do not have signals which may be a source of noise around the node.

- When RT0/RT1 (Thermistor and etc.) requires long wiring due to the restricted placement, please have VSS(GND) trace next to the signal.
- Please make wiring to components (capacitor, resistor and etc.) necessary for objective measurement. Wiring to reserved components may affect to the A/D conversion operation by noise the components itself may have.

● Electrical Characteristics of Successive Approximation Type A/D Converter

Figure D-1 Application Circuit Example

Appendix E Check List

This Check List has notes to prevent commonly-made programming mistakes and frequently overlooked or misunderstood hardware features of the MCU. Check each note listed up chapter by chapter while coding the program or evaluating it using the MCU.

Chapter 1 Overview

[] Please confirm how to handle the unused pins(Refer to Section 1.3.4 in the user's manual).

Chapter 2 CPU and Memory

• Program Memory size

[] 64,512 Byte (0:0000H to 0:FBFFH)

• Data RAM size

[] 2048 Byte (0:E000H to 0:E7FFH)

• Unused area

[] Please fill test area 0:FC00H to 0:FDFFH with BRK instruction code "0FFH" (Refer to a startup file "S61043XSW.asm" for programming in the source code).

[] For fail safe in your system, please fill unused program memory area (your program code does not use) with BRK instruction code "0FFH". We will fill the area with the code "0FFH" at LAPIS semiconductor's factory programming.

• Initializing RAM

[] The hardware reset does not initialize RAM. Please initialize RAM by the software.

Chapter 3 Reset

• Reset activation pulse width

[] Minimum 200us (Refer to Appendix C-2 in the user's manual)

• Power-on reset occurrence power rising time

[] Maximum 10ms (Refer to Appendix C-2 in the user's manual)

• Reset status flag

[] No flag is provided that indicates the occurrence of reset by the RESET_N pin (Refer to section 3.2.2. in the user's manual).

• BRK instruction reset

[] In system reset by the BRK instruction, no special function register (SFR) is initialized either. Therefore initialize the SFRs by your software.

Chapter 4 Standby control / MCU control

• STOP mode

[] Please note the STPACP is not enabled when both interrupt enable flags and the interrupt request flags are "1" & MIE flag is "0" (Refer to Section 4.2.2~4.2.3. in the user's manual).

[] Place two NOP instructions next to the instruction that sets the STP bit to "1"(Refer to Section 4.3.3. in the user's manual).

• HALT mode

[] Place two NOP instructions next to the instruction that sets the HLT bit to "1"(Refer to Section 4.3.2. in the user's manual).

• BLKCON registers

[] BLKCON registers enable or disable corresponsive each peripheral (Refer to Section 4.2.4 ~ 4.2.8. in the user's manual).

[] When certain bits of block control registers are set to "1", corresponding peripherals are reset (all registers are reset) and operating clocks for the peripherals stop.

[] DXTSP bit (bit 4) of BLKCON4 register disables the operation of 32kHz oscillation stop detector in only HALT mode.

Chapter 5 Interrupt

• Unused interrupt vector table

[] Please define all unused interrupt vector tables for fail safe.

• Non-maskable interrupt

[] The watchdog timer interrupt (WDTINT) and the NMI interrupt (NMINT) are non-maskable interrupts that do not depend on MIE flag(Refer to Section 5.2.9. and 5.3).

Chapter 6 Clock generation circuit

• Initial System clock

[] At power up or system reset, both built-in 500kHz RC oscillation and 32.768kHz crystal oscillation are oscillating, and 1/8 of the 500kHz RC oscillation clock(62.5kHz) is selected as a system clock for CPU.

• PLL oscillation clock

[] The PLL oscillation generates 8MHz clock which can be driven to an output pin, however the maximum CPU operating frequency is 4MHz.

• Switching high-speed clock operation mode to low-speed clock operation mode

[] When switching the high-speed clock to the low-speed clock after the power up, confirm the low-speed clock is oscillating for sure by checking Q128H bit is "1".

• Switching high-speed clock operation mode to another high-speed clock operation mode

[] When switching the high-speed clock mode, the clock must be first switched back to low clock before switching to other high-speed clock (Refer to Section 6.2.2.).

• Port 2nd Function

[] Specify the 2nd function for the port 2 when driving a clock to the pin(Refer to Section 6.4 in the user's manual).

[] A high-speed crystal/ceramic oscillation or an external clock input mode does not require specifying the 2nd function for the port 1(Refer to Section 19.3.2.)

Chapter 7 TBC (Time Base Counter)

• HTBCLK

[] HTBLK goes through the HTBDR register. Set proper valute to the register(Refer to Section 7.2.3. in the user's manual).

• How to read LTBC

[] Read consecutively LTBC(Low-speed Time Base Counter) twice until the last data coincides the previous data to prevent reading of uncertain data while counting up the clock (Refer to Section 7.3.1 in the user's manual).

Chapter 8 RTC (Real Time Clock)

• How to read the RTC registers

[] Read consecutively clock data registers twice until the last data coincides the previous data to prevent reading of uncertain data while counting up the clock (Refer to Section 8.3 in the user's manual).

Chapter 11 Timer

• How to read the timer counter registers

[] Check notes for reading the timer counter registers while counting up(Refer to Section 11.2.6. ~ 11.2.9. in the user's manual).

Chapter 12 PWM

• Used Pin

[] P34(PWM0) pin or P43(PWM0) pin is used.

• How to read the PWM counter registers

[] Check notes for reading the PWM counter registers while the PWM is operating(Refer to Section 12.2.4. in the user's manual).

• Port 2nd Function

[] Specify the 2nd Function for the port(Refer to Section 12.4 in the user's manual).

Chapter 13 WDT

• Overflow period

Clear WDT during the selected overflow period:

[] 125ms, [] 500ms, [] 2s, [] 8s

• WDP

[] Check the WDP before writing to the WDTCON and determine writing "5AH" or "0A5H" (Refer to Section 13.2.2. in the user's manual).

Chapter 14 SSIO

• Used pin

[] P40(SIN0), P41(SCK0) and P42(SOUT0) are used, or P44(SIN0), P45(SCK0) and P46(SOUT0) are used.

• Port 2nd Function

[] Specify the 2nd Function for the port (Refer to Section 14.4. in the user's manual)

Chapter 15 UART

• Used pin

[] P02(RXD0) and P43(TXD0) are used, or [] P42(RXD0) and P43(TXD0) are used.

[] Select the P02 or P42 for RXD0 by specifying U0RSEL bit of UA0MOD0 register.

• Port 2nd Function

[] Specify the 2nd Function for the port (Refer to Section 15.4. in the user's manual)

Chapter 16 I2C

• Used pin

[] P40(SDA) pin and P41(SCL) pin used.

• Port 2nd Function

[] Specify the 2nd Function for the port (Refer to Section 16.4. in the user's manual)

Chapter 17 NMI

• Handling the pin

[] Don't leave Hi-impedance NMI pin in floating state.

Chapter 18 ~ Chapter 23 Port

• Handling the pin

[] Don't leave Hi-impedance Input ports in floating state.

• Port 2nd Function

[] Specify properly PnCON0/1 and PnMOD0/1 registers for each port.

• Port A

[] ML610Q432 does Not have port A.

Chapter 24 Melody / Buzzer

• Enabling the LSCLK x 2

[] Set ENMLT bit of FCON1 register to "1" to enable the low-speed double clock (LSCLK x 2) before stating the melody or buzzer outputs.

• Port 2nd Function

[] Specify the 2nd Function for the port (Refer to Section 24.4. in the user's manual)

Chapter 25 RC oscillation type A/D converter

• Counter register

[] Reading the counter register A or B during the A/D conversion, returns the data written before starting the A/D conversion.

• Oscillation monitor pin

[] P35/RCM pin is a monitor pin for oscillation clock. The channel 0(P34-P30) and channel 1(P47-P44) share the monitor pin.

[] Please use P35/RCM for the evaluation purpose and disable the output while operating in an actual application to minimize the noise.

• Port 2nd Function

[] Specify the 2nd Function for the port (Refer to Section 25.4. in the user's manual).

[] All the Port 3 pins except P35/RCM are configured as pins dedicated to the RC-ADC function during A/D conversion(Refer to Section 25.3.1. in the user's manual).

Chapter 26 Successive Approximation type A/D converter

• Operating conditions

- [] Please confirm the operating voltage and the clock frequency.
V_{DD}=1.8V~3.6V (HSCLK=375KHz~1.1MHz or 1.99MHz~4.2MHz), AV_{DD}=2.2V~3.6V

• Others

- [] Use the A/D converter when the HSCLK is oscillating.
[] Do not set SARUN bit of SADCON1 register to "1" on the condition both SACH0 bit and SACH1 bit of SADMODO register are "0" (Refer to Section 26.2.7 ~ Section 26.2).

Chapter 27 LCD driver

• Bias

- [] 1/3 bias or [] 1/4 bias

• Duty

- [] ML610Q431: 1/1 ~ 1/16 duty
[] ML610Q432: 1/1 ~ 1/24 duty

• COM/SEG

- [] ML610Q431: 16COM x 64SEG
[] ML610Q432: 24COM x 64SEG

• External capacitor

(1/3 bias)

- [] Ca=1uF (connected to VL1 pin), [] Cb=1uF (connected to VL2 pin),
[] Cd=1uF (connected to VL4 pin),
[] C12=1uF (connected between C1 and C2 pin), [] C34=1uF (connected between C3 and C4 pin)

(1/4 bias)

- [] Ca=1uF (connected to VL1 pin), [] Cb=1uF (connected to VL2 pin),
[] Cc=1uF (connected to VL3 pin), [] Cd=1uF (connected to VL4 pin),
[] C12=1uF (connected between C1 and C2 pin), [] C34=1uF (connected between C3 and C4 pin)

Chapter 28 BLD (Battery Low Detector)

• Changing the threshold

- [] Please select the threshold voltage when the BLD circuit is OFF.

Chapter 29 Power circuit

• External capacitor

- [] CL0=1uF (connected to VDDL pin), [] Cx=0.1uF (connected to VDDX pin)

Chapter 30 On-chip debug

- [] Supply 3.0V ~ 3.6V to VDD pin when programming (erasing and writing) the Flash ROM with LAPIS semiconductor development tool uEASE.
[] Please do not apply LSIs being used for debugging to mass production.
[] Please validate the ROM code on your production board without LAPIS semiconductor development tool uEASE.

Appendix A SFR (Specific Function Registers)

• Initial data

- [] Please confirm there are some SFRs have undefined initial value at reset (Refer to Appendix A in the user's manual).

Appendix C Electrical Characteristics

• Operating temperature

- [] -20°C to +70°C

• Operating voltage vs Operating frequency

- [] Please confirm the operating conditions.
[] +1.1V to +3.6V (30kHz to 36kHz: Low-speed crystal oscillation clock operation)
[] +1.3V to +3.6V (30kHz to 625kHz: Built-in RC oscillation clock operation)
[] +1.8V to +3.6V (30kHz to 4.2MHz: High-speed crystal/ceramic oscillation clock or built-in PLL oscillation clock)
