

NCV4264-2

Low I_Q Low Dropout Linear Regulator

The NCV4264-2 is functionally and pin for pin compatible with NCV4264 with a lower quiescent current consumption. Its output stage supplies 100 mA with $\pm 2.0\%$ output voltage accuracy.

Maximum dropout voltage is 500 mV at 100 mA load current.

It is internally protected against 45 V input transients, input supply reversal, output overcurrent faults, and excess die temperature. No external components are required to enable these features.

Features

- 3.3 V and 5.0 V Fixed Output
- $\pm 2.0\%$ Output Accuracy, Over Full Temperature Range
- 60 μ A Maximum Quiescent Current at $I_{OUT} = 100 \mu$ A
- 500 mV Maximum Dropout Voltage at 100 mA Load Current
- Wide Input Voltage Operating Range of 4.5 V to 45 V
- AEC-Q100 Qualified
- Internal Fault Protection
 - ♦ -42 V Reverse Voltage
 - ♦ Short Circuit/Overcurrent
 - ♦ Thermal Overload
- NCV Prefix for Automotive and Other Applications Requiring Site and Control Changes
- This is a Pb-Free Device

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 9 of this data sheet.

NCV4264-2

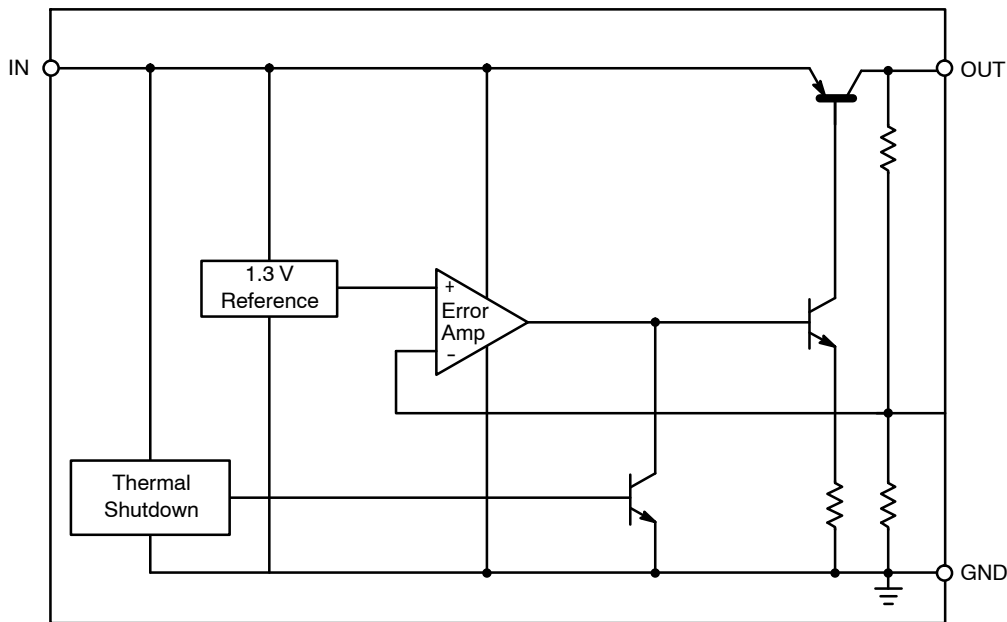

Figure 1. Block Diagram

PIN FUNCTION DESCRIPTION

Pin No.	Symbol	Function
1	V_{IN}	Unregulated input voltage; 4.5 V to 45 V.
2	GND	Ground; substrate.
3	V_{OUT}	Regulated output voltage; collector of the internal PNP pass transistor.
TAB	GND	Ground; substrate and best thermal connection to the die.

OPERATING RANGE

Rating	Symbol	Min	Max	Unit
V_{IN} , DC Input Operating Voltage (Note 3)	V_{IN}	4.5	+45	V
Junction Temperature Operating Range	T_J	-40	+150	°C

MAXIMUM RATINGS

Rating	Symbol	Min	Max	Unit
V_{IN} , DC Input Voltage	V_{IN}	-42	+45	V
V_{OUT} , DC Voltage	V_{OUT}	-0.3	+18	V
Storage Temperature	T_{stg}	-55	+150	°C
Moisture Sensitivity Level	MSL	3		-
ESD Capability, Human Body Model (Note 1)	V_{ESDHB}	4000	-	V
ESD Capability, Machine Model (Note 1)	V_{ESDMIM}	200	-	V
Lead Temperature Soldering Reflow (SMD Styles Only), Lead Free (Note 2)	T_{sld}	-	265 pk	°C

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. This device series incorporates ESD protection and is tested by the following methods:

ESD HBM tested per AEC-Q100-002 (EIA/JESD22-A 114C)

ESD MM tested per AEC-Q100-003 (EIA/JESD22-A 115C)

2. Lead Free, 60 sec – 150 sec above 217°C, 40 sec max at peak.

3. See specific conditions for DC operating input voltage lower than 4.5 V in the ELECTRICAL CHARACTERISTICS table at page 3

Circuit Description

The NCV4264-2 is functionally and pin for pin compatible with NCV4264 with a lower quiescent current consumption. Its output stage supplies 100 mA with $\pm 2.0\%$ output voltage accuracy.

Maximum dropout voltage is 500 mV at 100 mA load current. It is internally protected against 45 V input transients, input supply reversal, output overcurrent faults, and excess die temperature. No external components are required to enable these features.

Regulator

The error amplifier compares the reference voltage to a sample of the output voltage (V_{OUT}) and drives the base of a PNP series pass transistor by a buffer. The reference is a bandgap design to give it a temperature-stable output. Saturation control of the PNP is a function of the load current and input voltage. Oversaturation of the output power device is prevented, and quiescent current in the ground pin is minimized.

Regulator Stability Considerations

The input capacitor C_{I1} in Figure 2 is necessary for compensating input line reactance. Possible oscillations caused by input inductance and input capacitance can be damped by using a resistor of approximately $1\ \Omega$ in series with C_{I2} . The output or compensation capacitor, C_{OUT} helps determine three main characteristics of a linear regulator: startup delay, load transient response and loop stability. Tantalum, aluminum electrolytic, film, or ceramic capacitors are all acceptable solutions, however, attention must be paid to ESR constraints. The capacitor manufacturer's data sheet usually provides this information. The value for the output capacitor C_{OUT} shown in Figure 2 should work for most applications; however, it is not necessarily the optimized solution. Stability is guaranteed at values of $C_Q \geq 10\ \mu\text{F}$, with an $\text{ESR} \leq 9\ \Omega$ for the 5.0 V Version, and $C_Q \geq 22\ \mu\text{F}$ with an $\text{ESR} \leq 16\ \Omega$ for the 3.3 V Version within the operating temperature range. Actual limits are shown in a graph in the Typical Performance Characteristics section.

Calculating Power Dissipation in a Single Output Linear Regulator

The maximum power dissipation for a single output regulator (Figure 3) is:

$$P_{D(\max)} = [V_{IN(\max)} - V_{OUT(\min)}] * I_{Q(\max)} + V_{I(\max)} * I_Q \quad (\text{eq. 1})$$

Where:

$V_{IN(\max)}$ is the maximum input voltage,

$V_{OUT(\min)}$ is the minimum output voltage,

$I_{Q(\max)}$ is the maximum output current for the application, and I_Q is the quiescent current the regulator consumes at $I_{Q(\max)}$. Once the value of $P_{D(\max)}$ is known, the maximum permissible value of $R_{\theta JA}$ can be calculated:

$$R_{\theta JA} = \frac{(150^\circ\text{C} - T_A)}{P_D} \quad (\text{eq. 2})$$

The value of $R_{\theta JA}$ can then be compared with those in the package section of the data sheet. Those packages with $R_{\theta JA}$'s less than the calculated value in Equation 2 will keep the die temperature below 150°C . In some cases, none of the packages will be sufficient to dissipate the heat generated by the IC, and an external heat sink will be required. The current flow and voltages are shown in the Measurement Circuit Diagram.

Heat Sinks

A heat sink effectively increases the surface area of the package to improve the flow of heat away from the IC and into the surrounding air. Each material in the heat flow path between the IC and the outside environment will have a thermal resistance. Like series electrical resistances, these resistances are summed to determine the value of $R_{\theta JA}$:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CS} + R_{\theta SA} \quad (\text{eq. 3})$$

Where:

$R_{\theta JC}$ = the junction-to-case thermal resistance,

$R_{\theta CS}$ = the case-to-heat sink thermal resistance, and

$R_{\theta SA}$ = the heat sink-to-ambient thermal resistance.

$R_{\theta JA}$ appears in the package section of the data sheet. Like $R_{\theta JA}$, it too is a function of package type. $R_{\theta CS}$ and $R_{\theta SA}$ are functions of the package type, heat sink and the interface between them. These values appear in data sheets of heat sink manufacturers. Thermal, mounting, and heat sinking are discussed in the ON Semiconductor application note AN1040/D, available on the ON Semiconductor Website.
