

Overvoltage and Overcurrent Protection IC and Li+ Charger Front-End Protection IC With LDO Mode

FEATURES

- Input Overvoltage Protection
- Accurate Battery Overvoltage Protection
- Output Short-Circuit Protection
- Soft-Start to Prevent Inrush Currents
- Soft-Stop to Prevent Voltage Spikes
- 30-V Maximum Input Voltage
- Supports up to 1.7-A Load Current
- Thermal Shutdown
- Enable Function
- Fault Status Indication
- Small 2 mm × 2 mm 8-Pin SON Package

APPLICATIONS

- Smart Phones, Mobile Phones
- PDAs
- MP3 Players
- Low-Power Handheld Devices

DESCRIPTION

The bq2438x family are charger front-end integrated circuits designed to provide protection to Li-ion batteries from failures of the charging circuitry. The IC continuously monitors the input voltage and the battery voltage. The device operates like a linear regulator, maintaining a 5.5-V (bq24380) or 5-V (bq24381, bq24382) output with input voltages up to the Input overvoltage threshold. During input overvoltage conditions, the IC immediately turns off the internal pass FET disconnecting the charging circuitry from the damaging input source. Additionally, if the battery voltage rises to unsafe levels while charging, power is removed from the system. The IC checks for short-circuit or overload conditions at its output when turning the pass FET on, and if it finds unsafe conditions, it switches off, and then rechecks the conditions. Additionally, the IC also monitors its die temperature and switches off if it exceeds 140°C.

When the IC is controlled by a processor, the IC provides status information about fault conditions to the host.

APPLICATION SCHEMATIC

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Copyright © 2008–2009, Texas Instruments Incorporated

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION

DEVICE	V _{OVP}	V _{O(REG)}	PACKAGE ⁽¹⁾	MARKING
bq24380	6.3 V	5.5 V	2mm x 2mm SON	CFE
bq24381	7.1 V	5 V	2mm x 2mm SON	CFW
bq24382	10.5 V	5 V	2mm x 2mm SON	OBE

DEVICE INFORMATION

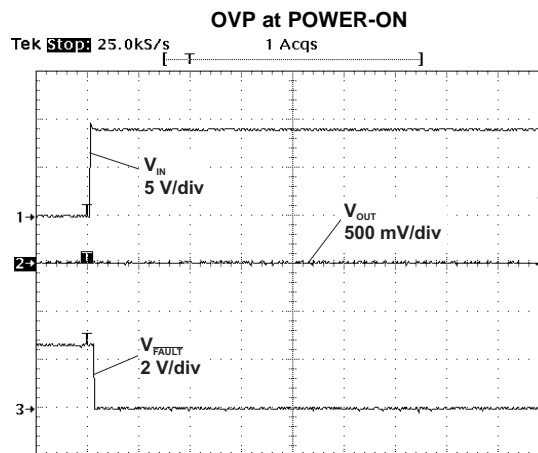

TERMINAL FUNCTIONS

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
IN	1	I	Input power, connected to external DC supply. Bypass IN to VSS with a ceramic capacitor (1 μ F minimum)
VSS	2	–	Ground terminal. Connect to the thermal pad and to the ground rail of the circuit.
NC	3, 7		Do not connect to any external circuits. These pins may have internal connections used for test purposes.
$\overline{\text{FAULT}}$	4	O	Open-drain device status output. $\overline{\text{FAULT}}$ is pulled to VSS internally when the input pass FET has been turned off due to input overvoltage or output short-circuit conditions, an overtemperature condition, or because the battery voltage is outside safe limits. $\overline{\text{FAULT}}$ is high impedance during normal operation.
$\overline{\text{CE}}$	5	I	Active-low chip enable input. Connect $\overline{\text{CE}}$ = HI to turn the input pass FET off. Connect $\overline{\text{CE}}$ = LOW to turn the internal pass FET on and connect the input to the charging circuitry. $\overline{\text{CE}}$ is Internally pulled down, ~200 k Ω .
VBAT	6	I	Battery voltage sense input. Connected to pack positive terminal through a 100-k Ω resistor.
OUT	8	O	Output terminal to the charging system. Bypass OUT to VSS with a ceramic capacitor (1 μ F minimum)
Thermal PAD			The thermal pad is electrically connected to VSS internally. The thermal pad must be connected to the same potential as the VSS pin on the printed circuit board. Do not use the thermal pad as the primary ground input for the device. VSS pin must be connected to ground at all times.

DETAILED FUNCTIONAL DESCRIPTION

The bq2438x is a highly integrated circuit designed to provide protection to Li-ion batteries from failures of the charging circuit and the input source. The IC continuously monitors the input voltage and the battery voltage. The device operates like a linear regulator, maintaining a 5.5-V (bq24380) or 5-V (bq24381, bq24382) output with input voltages up to the input overvoltage threshold (V_{OVP}). If the input voltage exceeds V_{OVP} , the IC shuts off the pass FET and disconnects the system from input power. Additionally, if the battery voltage rises above 4.35 V, the IC switches off the pass FET, removing the power from the system until the battery voltage falls to safe levels. The IC also monitors its die temperature and switches the pass FET off if it exceeds 140°C.

The IC can be controlled by a processor, and also provides status information about fault conditions to the host.

POWER DOWN

The device remains in power-down mode when the input voltage at the IN pin is below the undervoltage threshold (UVLO) of 2.8 V. The FET connected between the IN and OUT pins is off, and the status output, $\overline{\text{FAULT}}$, is set to HI-Z.

POWER ON RESET

The device resets when the input voltage at the IN pin exceeds the UVLO threshold. During power-on reset, the IC waits for duration $t_{DGL(PGOOD)}$ for the input voltage to stabilize. If, after $t_{DGL(PGOOD)}$, the input voltage and battery voltage are within operation limits, the pass FET is turned ON. The IC has a soft-start feature to control the inrush current. The soft-start minimizes the ringing at the input due to the resonant circuit formed by the parasitic inductance of the adapter cable and the input bypass capacitor. During the soft-start time, t_{SStart} , the current limit is stepped up in 8 equal steps every 625µs. Each step is 1/8 of the $I_{O(SC)}$. After the soft-start sequence is over, the IC samples the load current. If the load current exceeds $I_{O(SC)}$, the IC initiates short circuit protection. See the [Startup Short-Circuit Protection](#) section for details. If no overcurrent event is measured, the current monitoring circuitry is disabled for normal operation.

In the event a short-circuit is detected at power-on, to prevent the input voltage from spiking up when the pass FET is switched off (due to the inductance of the input cable), The pass FET is turned off by gradually reducing its gate-drive, resulting in a *soft-stop* (t_{SStop}).

DETAILED FUNCTIONAL DESCRIPTION

The device continuously monitors the input voltage and the battery voltage as described in detail below:

Input Overvoltage Protection

The OUT output of the bq2438x operates similar to a linear regulator. While the input voltage is less than $V_{O(REG)}$, and above the UVLO, the output voltage tracks the input voltage (less the drop caused by $R_{DS(on)}$ of the pass FET). When the input voltage is greater than $V_{O(REG)}$ (plus the $R_{DS(on)}$ drop) and less than V_{OVP} , the output voltage is regulated to $V_{O(REG)}$. $V_{O(REG)}$ is 5.5 V for the bq24380, and 5 V for the bq24381 and bq24382. If the input voltage is increased above V_{OVP} , the internal pass FET is turned off, removing power from the charging circuitry connected to OUT. The $\overline{\text{FAULT}}$ output is then asserted low. When the input voltage drops below $V_{OVP} - V_{hys(OVP)}$ (but is still above UVLO), the pass FET is turned on after a deglitch time of $t_{REC(OVP)}$. The deglitch time ensures that the input supply has stabilized. The *condition 5* in [Figure 18](#) illustrates an input overvoltage event.

Battery Overvoltage Protection

The battery overvoltage threshold BV_{OVP} is internally set to 4.35 V for the bq2438x. *Condition 3* in [Figure 18](#) illustrates a battery overvoltage event. If the battery voltage exceeds the BV_{OVP} threshold for longer than $t_{DGL(BVovp)}$, the pass FET is turned off (using soft-stop), and $\overline{\text{FAULT}}$ is asserted low. The pass FET is turned on (using the soft-start sequence) once the battery voltage drops to $BV_{OVP} - V_{hys(BVovp)}$.

Thermal Protection

If the junction temperature of the device exceeds $T_{J(OFF)}$, the pass FET is turned off, and the $\overline{\text{FAULT}}$ output is asserted low. The FET is turned on when the junction temperature falls below $T_{J(OFF)} - T_{J(OFF-HYS)}$.

Start-Up Short-Circuit Protection

The bq2438x features overload current protection during start-up. The *condition 1* in [Figure 18](#) illustrates start-up into an overload condition. If after the eight soft-start steps are complete, and the current limit is exceeded, the IC initiates a short-circuit check timer ($t_{CHK(SC)}$). During this check, the current is clamped to $I_{O(SC)}$. If the 5-ms $t_{CHK(SC)}$ timer expires and the current remains clamped by the current limit, the internal pass FET is turned off using the soft-stop method, \overline{FAULT} is pulled low and the $t_{REC(SC)}$ timer begins. Once the $t_{REC(SC)}$ timer expires, \overline{FAULT} becomes high impedance and the soft-start sequence restarts. The device repeats the start/fail sequence until the overload condition is removed. Once the overload condition is removed, the current limit circuitry is disabled and the device enters normal operation. Additionally, if the current is not limited after the completion of the soft-start sequence, the $t_{CHK(SC)}$ timer does not start and the current limit circuitry is disabled for normal operation.

Enable Function

The IC has an enable pin which is used to enable and disable the device. Connect the \overline{CE} pin high to turn off the internal pass FET. Connect the \overline{CE} pin low to turn on the internal pass FET and enter the start-up routine. The \overline{CE} pin has an internal pulldown resistor and can be left unconnected. The \overline{FAULT} pin is high impedance when the \overline{CE} pin is high.

Fault Indication

The \overline{FAULT} pin is an active-low, open-drain output. It is in a high-impedance state when operating conditions are safe, or when the device is disabled by setting \overline{CE} high. With \overline{CE} low, the \overline{FAULT} pin goes low whenever any of these events occurs:

1. Output short-circuit at power-on
2. Input overvoltage
3. Battery overvoltage
4. IC overtemperature

See [Figure 18](#) for an example of \overline{FAULT} conditions during these events. Connect the \overline{FAULT} pin to the desired logic level voltage rail through a resistor between 1 k Ω and 50 k Ω .

APPLICATION INFORMATION

Selection of $R_{(BAT)}$

It is recommended that the battery not be tied directly to the VBAT pin of the device, as under some failure modes of the IC, the voltage at the IN pin may appear on the VBAT pin. This voltage can be as high as 30 V, and applying 30 V to the battery may cause failure of the device and can be hazardous. Connecting the VBAT pin through $R_{(BAT)}$ prevents a large current from flowing into the battery in the event of failure. For safety, $R_{(BAT)}$ must have a high value. The problem with a large $R_{(BAT)}$ is that the voltage drops across the resistor because of the VBAT bias current, $I_{(VBAT)}$, which causes an error in the BV_{OVP} threshold. This error is over and above the tolerance on the nominal 4.35-V BV_{OVP} threshold.

Choosing $R_{(BAT)}$ in the range of 100 k Ω to 470 k Ω is a good compromise. If the IC fails with $R_{(BAT)}$ equal to 100 k Ω , the maximum current flowing into the battery would be $(30\text{ V} - 3\text{ V}) \div 100\text{ k}\Omega = 246\text{ }\mu\text{A}$, which is low enough to be absorbed by the bias currents of the system components. $R_{(BAT)}$ equal to 100 k Ω results in a worst-case voltage drop of $R_{(BAT)} \times I_{(VBAT)} \approx 1\text{ mV}$. This is negligible compared to the internal tolerance of 50 mV on the BV_{OVP} threshold.

If the Bat-OVP function is not required, the VBAT pin must be connected to VSS.

Selection of $R_{(CE)}$

The \overline{CE} pin can be used to enable and disable the IC. If host control is not required, the \overline{CE} pin can be tied to ground or left unconnected, permanently enabling the device.

In applications where external control is required, the \overline{CE} pin can be controlled by a host processor. As with the VBAT pin (see previous discussion), the \overline{CE} pin must be connected to the host GPIO pin through as large a resistor as possible. The limitation on the resistor value is that the minimum V_{OH} of the host GPIO pin less the drop across the resistor must be greater than V_{IH} of the bq2430x \overline{CE} pin. The drop across the resistor is given by $R_{(CE)} \times I_{IH}$.

Selection of Input and Output Bypass Capacitors

The input capacitor C_{IN} in Figure 17 is for decoupling and serves an important purpose. Whenever a step change downwards in the system load current occurs, the inductance of the input cable causes the input voltage to spike up. C_{IN} prevents the input voltage from overshooting to dangerous levels. It is recommended that a ceramic capacitor of at least 1 μF be used at the input of the device. It must be located in close proximity to the IN pin.

C_{OUT} in Figure 17 is also important. During an overvoltage transient, this capacitance limits the output overshoot until the power FET is turned off by the overvoltage protection circuitry. C_{OUT} must be a ceramic capacitor of at least 1 μF , located close to the OUT pin. C_{OUT} also serves as the input decoupling capacitor for the charging circuit downstream of the protection IC.

PCB Layout Guidelines

1. This device is a protection device and is meant to protect down-stream circuitry from hazardous voltages. Potentially, high voltages may be applied to this IC. It has to be ensured that the edge-to-edge clearances of PCB traces satisfy the design rules for the maximum voltages expected to be seen in the system.
2. The device uses SON packages with a PowerPAD™. For good thermal performance, the PowerPAD must be thermally coupled with the PCB ground plane. In most applications, this requires a copper pad directly under the IC. This copper pad should be connected to the ground plane with an array of thermal vias.
3. C_{IN} and C_{OUT} should be located close to the IC. Other components like $R_{(BAT)}$ should also be located close to the IC.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

DSG (S-PWSON-N8)

PLASTIC SMALL OUTLINE NO-LEAD

4208210/B 10/10

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Quad Flatpack, No-Leads (QFN) package configuration.
 -  The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
 - E. Falls within JEDEC MO-229.

THERMAL PAD MECHANICAL DATA

DSG (S-PWSON-N8)

PLASTIC SMALL OUTLINE NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

4208347/G 08/13

NOTE: All linear dimensions are in millimeters

DSG (S-PWSON-N8)

PLASTIC SMALL OUTLINE NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - F. Customers should contact their board fabrication site for solder mask tolerances.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
