

Synchronous Buck NexFET™ Power Stage

FEATURES

- 60A Continuous Operating Current Capability
- 92.4% System Efficiency at 30A
- Ultra Low Power Loss of 3.3W at 30A
- High Frequency Operation (up to 2 MHz)
- High Density - SON 5x6-mm Footprint
- Ultra Low Inductance Package
- System Optimized PCB Footprint
- 3.3V and 5V PWM Signal Compatible
- Diode Emulation Mode with FCCM
- Analog Temperature Output
- Input Voltages up to 16V
- Three-State PWM Input
- Integrated Bootstrap Switch
- Optimized Dead Time for Shoot Through Protection
- RoHS Compliant – Lead Free Terminal Plating
- Halogen Free

APPLICATIONS

- Multiphase Synchronous Buck Converter
 - High Frequency Applications
 - High Current, Low Duty Cycle Applications
- Point-of-Load DC-DC Converters
- Memory and Graphic Cards
- Desktop and Server VR11.x and VR12.x for VCore Synchronous Buck Converters

ORDERING INFORMATION

Device	Package	Media	Qty	Ship
CSD95372AQ5M	SON 5 × 6-mm Plastic Package	13-Inch Reel	2500	Tape and Reel

DESCRIPTION

The CSD95372AQ5M NexFET™ Power Stage is a highly optimized design for use in a high power, high density Synchronous Buck converters. This product integrates the driver IC and NexFET technology to complete the power stage switching function. The driver IC has a built-in selectable diode emulation function that enables DCM operation to improve light load efficiency. This combination produces high current, high efficiency, and high speed switching capability in a small 5x6mm outline package. It also integrates the temperature sensing functionality to simplify system design and improve accuracy. In addition, the PCB footprint has been optimized to help reduce design time and simplify the completion of the overall system design.

PIN CONFIGURATION

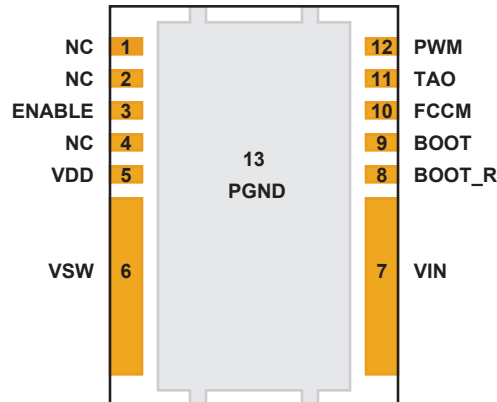

Figure 12. Top View

PIN DESCRIPTION

PIN		DESCRIPTION
NO.	NAME	
1, 2, 4	NC	No Connect, must leave floating
3	ENABLE	Enables device operation. If ENABLE = logic HIGH, turns on device. If ENABLE = logic LOW, the device is turned off and both MOSFET gates are actively pulled low. An internal 100kΩ pull down resistor will pull the ENABLE pin LOW if left floating.
5	V _{DD}	Supply Voltage to Gate Driver and internal circuitry
6	V _{SW}	Phase node connecting the HS MOSFET Source and LS MOSFET Drain - pin connection to the output inductor
7	V _{IN}	Input Voltage Pin. Connect input capacitors close to this pin.
8	BOOT_R	Return path for HS gate driver, connected to V _{SW} internally
9	BOOT	Bootstrap capacitor connection. Connect a minimum of 0.1μF 16V X7R, ceramic capacitor from BOOT to BOOT_R pins. The bootstrap capacitor provides the charge to turn on the Control FET. The bootstrap diode is integrated.
10	FCCM	This pin enables the Diode Emulation function. When this pin is held LOW, Diode Emulation Mode is enabled for Sync FET. When FCCM is HIGH, the device operated in Forced Continuous Conduction Mode. An internal 5μA current source will pull the FCCM pin to V _{DD} if left floating.
11	TAO/ FAULT	Temperature amplifier output. Reports a voltage proportional to the die temperature. An ORing diode is integrated in the IC. When used in multiphase application, a single wire can be used to connect the TAO pins of all the IC's. Only the highest temperature will be reported. TAO will be pulled up to 3V if Thermal Shutdown occurs. TAO should be bypassed to P _{GND} with a 1nF 16V X6R ceramic capacitor.
12	PWM	Pulse Width modulated 3-state input from external controller. Logic LOW sets Control FET gate low and Sync FET gate high. Logic HIGH sets Control FET gate high and Sync FET gate low. Open or High Z sets both MOSFET gates low if greater than the 3-State Shutdown Hold-off Time (t _{3HT})
13	P _{GND}	Power Ground

Figure 13. Functional Block Diagram

FUNCTIONAL DESCRIPTION

POWERING CSD95372AQ5M AND GATE DRIVERS

An external V_{DD} voltage is required to supply the integrated gate driver IC and provide the necessary gate drive power for the MOSFETS. The gate driver IC is capable of supplying in excess of 4A peak current into the MOSFET gates to achieve fast switching. A 1 μ F 10V X5R or higher ceramic capacitor is recommended to bypass V_{DD} pin to P_{GND} . A bootstrap circuit to provide gate drive power for the Control FET is also included. The bootstrap supply to drive the Control FET is generated by connecting a 100nF 16V X5R ceramic capacitor between BOOT and BOOT_R pins. An optional R_{BOOT} resistor can be used to slow down the turn on speed of the Control FET and reduce voltage spikes on the V_{SW} node. A typical 1 Ω to 4.7 Ω value is a compromise between switching loss and V_{SW} spike amplitude.

Undervoltage Lockout Protection (UVLO)

The V_{DD} supply is monitored for UVLO conditions and both Control FET and Sync FET gates are held low until adequate supply is available. An internal comparator evaluates the V_{DD} voltage level and if V_{DD} is greater than the Power On Reset threshold (V_{POR}), the gate driver becomes active. If V_{DD} is less than the UVLO threshold, the gate driver is disabled and the internal MOSFET gates are actively driven low. At the rising edge of the V_{DD} voltage, both Control FET and Sync FET gates will be actively held low during V_{DD} transitions between 1.0V to V_{POR} . This region is referred to as the Gate Drive Latch Zone, seen in [Figure 14](#). In addition, at the falling edge of the V_{DD} voltage, both Control FET and Sync FET gates are actively held low during the UVLO to 1 V transition.

The Power Stage CSD95372AQ5M device must be powered up and Enabled before the PWM signal is applied.

Figure 14. UVLO Operation

ENABLE

The ENABLE pin is TTL compatible. The logic level thresholds are sustained under all V_{DD} operating conditions between V_{POR} to V_{DD} . In addition, if this pin is left floating, a weak internal pull down resistor of 100k Ω will pull the ENABLE pin below the logic level low threshold. The operational functions of this pin should follow the timing diagram outlined in Figure 15. A logic level low will actively hold both Control FET and Sync FET gates low and V_{DD} pin should typically draw less than 5 μ A.

Figure 15. CSD95372AQ5M ENABLE Timing Diagram (V_{DD} = PWM = 5V)

POWER UP SEQUENCING

If the ENABLE signal is used, it is necessary to ensure proper co-ordination with the ENABLE and soft-start features of the external PWM controller in the system. If the CSD95372AQ5M was disabled through ENABLE without sequencing with the PWM IC controller, the buck converter output will have no voltage or fall below regulation set point voltage. As a result, the PWM controller IC delivers Max duty cycle on the PWM line. If the Power Stage is re-enabled by driving the ENABLE pin high, there will be an extremely large input inrush current when the output voltage builds back up again. The input inrush current might have undesirable consequences such as inductor saturation, driving the input power supply into current limit or even catastrophic failure of the CSD95372AQ5M device. Disabling the PWM controller is recommended when the CSD95372AQ5M is disabled. The PWM controller should always be re-enabled by going through soft-start routine to control and minimize the input inrush current and reduce current and voltage stress on all buck converter components. It is recommended that the external PWM controller be disabled when CSD95372AQ5M is disabled or nonoperational because of UVLO.

When ENABLE signal is toggled, there is an internal 3 μ s hold-off time before the driver will respond to PWM events to ensure the analog sensing circuitry is properly powered and stable. This hold-off time should be considered when designing the power-up sequencing of the controller IC and the Power Stage

PWM

The input PWM pin incorporates a 3-State function. The Control FET and Sync FET gates are forced low if the PWM pin is left floating for more than the 3-State Hold off time (t_{3HT}). The 3-state mode can be entered by actively driving the PWM input to the V_{T3} voltage or the PWM input can be made high impedance and internal current sources will driver PWM to V_{T3} . The PWM input can source up to I_{PWMH} and sink down to I_{PWML} current to drive PWM to the V_{T3} voltage, but will consume no current when sitting at the V_{T3} voltage. Operation in and out of 3-State mode should follow the timing diagram outlined in Figure 16. Both V_{PWML} and V_{PWMH} threshold levels are set to accommodate both 3.3V and 5V logic controllers. During normal operation, the PWM signal should be driven to logic levels Low and High with a maximum of 500Ω sink/source impedance respectively.

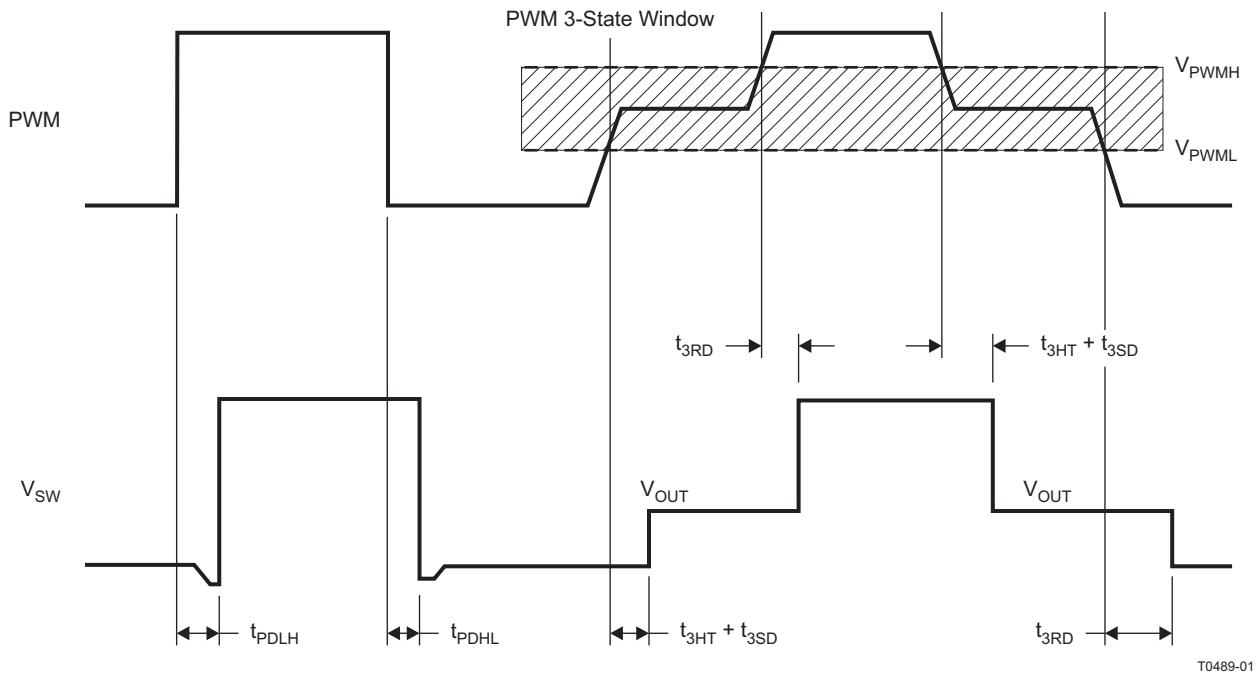

Figure 16. PWM Timing Diagram

FCCM

The input FCCM pin enables the Power Stage device to operate in either continuous current conduction mode or diode emulation mode. When FCCM is driven above its high threshold, the Power Stage will operate in continuous conduction mode regardless of the polarity of the output inductor current. When FCCM is driven below its low threshold, the Power Stage's internal zero-cross detection circuit is enabled. When the zero-cross detection circuit is active, diode emulation mode will be entered on the third consecutive PWM pulse in which a zero-crossing event is detected. If FCCM is driven high after diode emulation mode has been enabled, continuous conduction mode will begin after the next PWM event. See Figure 17 and Figure 18 for FCCM timing

TAO/FAULT (Thermal Analog Output/Protection Flag)

During normal operation the output TAO pin is a highly accurate analog temperature measurement of the lead-frame temperature of the Power Stage. Because the source junction of the Sync FET sits directly on the lead-frame of the Power Stage, this output can be used as an accurate measurement of the junction temperature of the Sync FET. The TAO pin should be bypassed to P_{GND} using a 1nF X7R ceramic capacitor to ensure accurate temperature measurement.

This Power Stage device has built-in over-temperature protection (described below) which is flagged by pulling TAO to 3V. The TAO pin also includes a built in ORing function. When connecting TAO pins of more than one device together, the TAO bus automatically reads the highest TAO voltage among all devices. This greatly simplifies the temperature sense and fault reporting design for multi-phase applications, where a single line TAO/FAULT bus can be used to tie the TAO pins of all phases together and the system can monitor the temperature of the hottest component.

Over Temperature

An overtemperature fault occurs when the dies temperature reaches Thermal Shutdown Temperature (see the Electrical Characteristics). An over-temperature event is the only fault condition to which the Power Stage will automatically react. When the over-temperature event is detected, the Power Stage will automatically turn off both HS and LS MOSFETs and pull TAO to 3.3V. If the temperature falls below the over-temperature threshold hysteresis band, the driver will again respond to PWM commands and the TAO pin will return to normal operation. A weak pull down is used to pull TAO back from a fault event so there is a significant delay before the TAO output will report the correct temperature.

Gate Drivers

This Power Stage has an internal high-performance gate driver IC that is trimmed to achieve minimum dead-time for lowest possible switching loss and switch-node ringing reduction. To eliminate the possibility of shoot-through at light load conditions, the dead-time is adjusted to a longer period when the inductor current is negative prior to a PWM HIGH input.

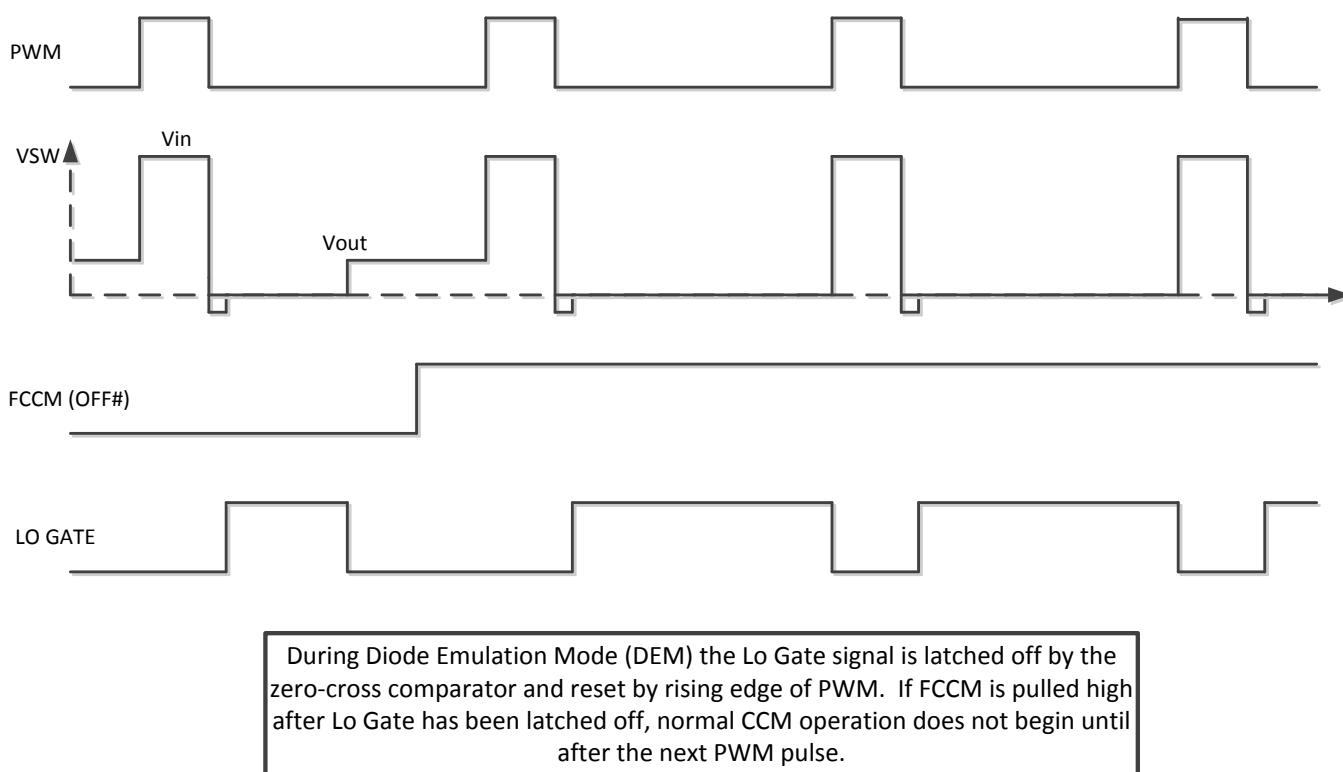

Figure 17. FCCM Rising Timing Diagram

CSD95372AQ5M

SLPS416A – JUNE 2013 – REVISED SEPTEMBER 2013

www.ti.com

Zero-cross detection is enabled by FCCM low. Diode-Emulation Mode is entered on the third consecutive PWM pulse in which a zero-crossing event is detected. If at any time no zero-cross event is detected when FCCM is low, the zero-cross counter is reset and diode-emulation mode is not enabled. If FCCM remains low, diode-emulation mode will be re-enabled on the third consecutive PWM pulse in which a zero-cross event is detected.

Figure 18. FCCM Falling Timing Diagram

APPLICATION INFORMATION

The Power Stage CSD95372AQ5M is a highly optimized design for synchronous buck applications using NexFET devices with a 5V gate drive. The Control FET and Sync FET silicon are parametrically tuned to yield the lowest power loss and highest system efficiency. As a result, a rating method is used that is tailored towards a more systems centric environment. The high-performance gate driver IC integrated in the package helps minimize the parasitics and results in extremely fast switching of the power MOSFETs. System level performance curves such as Power Loss, Safe Operating Area and normalized graphs allow engineers to predict the product performance in the actual application.

Power Loss Curves

MOSFET centric parameters such as $R_{DS(ON)}$ and Q_{gd} are primarily needed by engineers to estimate the loss generated by the devices. In an effort to simplify the design process for engineers, Texas Instruments has provided measured power loss performance curves. [Figure 3](#) plots the power loss of the CSD95372AQ5M as a function of load current. This curve is measured by configuring and running the CSD95372AQ5M as it would be in the final application (see). The measured power loss is the CSD95372AQ5M device power loss which consists of both input conversion loss and gate drive loss. [Equation 1](#) is used to generate the power loss curve.

$$\text{Power Loss} = (V_{IN} \times I_{IN}) + (V_{DD} \times I_{DD}) - (V_{SW_AVG} \times I_{OUT}) \quad (1)$$

The power loss curve in [Figure 3](#) is measured at the maximum recommended junction temperature of $T_J = 125^\circ\text{C}$ under isothermal test conditions.

Safe Operating Curves (SOA)

The SOA curves in the CSD95372AQ5M datasheet give engineers guidance on the temperature boundaries within an operating system by incorporating the thermal resistance and system power loss. [Figure 5](#) and [Figure 6](#) outline the temperature and airflow conditions required for a given load current. The area under the curve dictates the safe operating area. All the curves are based on measurements made on a PCB design with dimensions of 4.0" (W) x 3.5" (L) x 0.062" (T) and 6 copper layers of 1 oz. copper thickness.

Normalized Curves

The normalized curves in the CSD95372AQ5M data sheet give engineers guidance on the Power Loss and SOA adjustments based on their application specific needs. These curves show how the power loss and SOA boundaries will adjust for a given set of systems conditions. The primary Y-axis is the normalized change in power loss and the secondary Y-axis is the change in system temperature required in order to comply with the SOA curve. The change in power loss is a multiplier for the Power Loss curve and the change in temperature is subtracted from the SOA curve.

Calculating Power Loss and SOA

The user can estimate product loss and SOA boundaries by arithmetic means (see the Design Example). Though the Power Loss and SOA curves in this datasheet are taken for a specific set of test conditions, the following procedure will outline the steps engineers should take to predict product performance for any set of system conditions.

Design Example

Operating Conditions: Output Current (I_{OUT}) = 40A, Input Voltage (V_{IN}) = 7V, Output Voltage (V_{OUT}) = 1.5V, Switching Frequency (f_{SW}) = 800kHz, Output Inductor (L_{OUT}) = 0.2μH

Calculating Power Loss

- Typical Power Loss at 40A = 6.5W ([Figure 3](#))
- Normalized Power Loss for switching frequency ≈ 1.08 ([Figure 7](#))
- Normalized Power Loss for input voltage ≈ 1.06 ([Figure 8](#))
- Normalized Power Loss for output voltage ≈ 1.06 ([Figure 9](#))
- Normalized Power Loss for output inductor ≈ 1.01 ([Figure 10](#))
- **Final calculated Power Loss = $6.5\text{W} \times 1.08 \times 1.06 \times 1.06 \times 1.01 \approx 8.0\text{W}$**

CSD95372AQ5M

SLPS416A – JUNE 2013 – REVISED SEPTEMBER 2013

www.ti.com

Calculating SOA Adjustments

- SOA adjustment for switching frequency $\approx 3.2^{\circ}\text{C}$ (Figure 7)
- SOA adjustment for input voltage $\approx 2.4^{\circ}\text{C}$ (Figure 8)
- SOA adjustment for output voltage $\approx -0.8^{\circ}\text{C}$ (Figure 9)
- SOA adjustment for output inductor $\approx 0.5^{\circ}\text{C}$ (Figure 10)
- **Final calculated SOA adjustment = $3.2 + 2.4 + 2.4 + 0.5 \approx 8.5^{\circ}\text{C}$**

Figure 19. Power Stage CSD95372AQ5M SOA

In the design example above, the estimated power loss of the CSD95372AQ5M would increase to 8.0W. In addition, the maximum allowable board and/or ambient temperature would have to decrease by 8.5°C . Figure 19 graphically shows how the SOA curve would be adjusted accordingly.

1. Start by drawing a horizontal line from the application current to the SOA curve.
2. Draw a vertical line from the SOA curve intercept down to the board/ambient temperature.
3. Adjust the SOA board/ambient temperature by subtracting the temperature adjustment value.

In the design example, the SOA temperature adjustment yields a reduction in allowable board/ambient temperature of 8.5°C . In the event the adjustment value is a negative number, subtracting the negative number would yield an increase in allowable board/ambient temperature.

RECOMMENDED SCHEMATIC OVERVIEW

There are several critical components that must be used in conjunction with this Power Stage device. [Figure 20](#) shows a portion of a schematic with the critical components needed for proper operation.

- C1: Bootstrap Capacitor
- R1: Bootstrap Resistor
- C4: Bypass Capacitor for TAO
- C3: Bypass Capacitor for V_{DD}
- C5: Bypass Capacitor for V_{IN} to Help with Ringing Reduction
- C6: Bypass Capacitor for V_{IN}

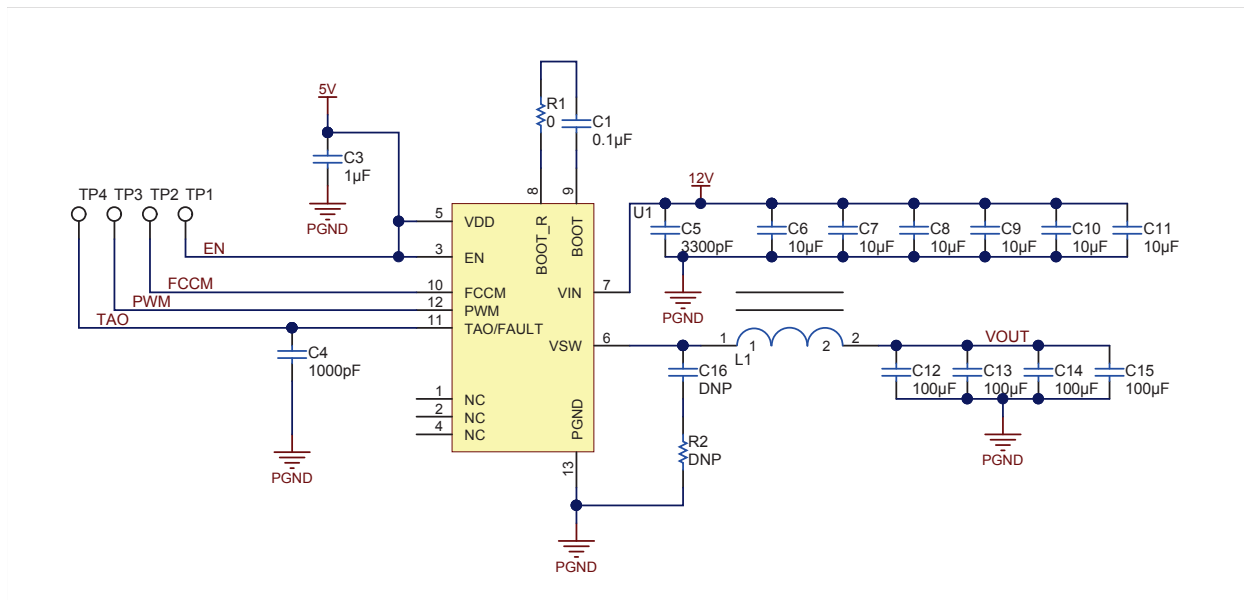

Figure 20. Recommended Schematic

RECOMMENDED PCB DESIGN OVERVIEW

There are two key system-level parameters that can be addressed with a proper PCB design: electrical and thermal performance. Properly optimizing the PCB layout will yield maximum performance in both areas. Below is a brief description on how to address each parameter.

Electrical Performance

The CSD95372AQ5M has the ability to switch at voltage rates greater than 10kV/μs. Special care must be then taken with the PCB layout design and placement of the input capacitors, inductor and output capacitors.

- The placement of the input capacitors relative to V_{IN} and P_{GND} pins of CSD95372AQ5M device should have the highest priority during the component placement routine. It is critical to minimize these node lengths. As such, ceramic input capacitors need to be placed as close as possible to the V_{IN} and P_{GND} pins (see Figure 21). The example in Figure 21 uses 1 x 3.3nF 0402 50V and 6 x 10μF 1206 25V ceramic capacitors (TDK Part # C3216X7R1C106KT or equivalent). Notice there are ceramic capacitors on both sides of the board with an appropriate amount of vias interconnecting both layers. In terms of priority of placement next to the Power Stage C5, C8 and C6, C19 should follow in order.
- The bootstrap cap C_{BOOT} 0.1μF 0603 16V ceramic capacitor should be closely connected between BOOT and BOOT_R pins
- The switching node of the output inductor should be placed relatively close to the Power Stage CSD95372AQ5M V_{SW} pins. Minimizing the V_{SW} node length between these two components will reduce the PCB conduction losses and actually reduce the switching noise level. ⁽¹⁾

Thermal Performance

The CSD95372AQ5M has the ability to use the GND planes as the primary thermal path. As such, the use of thermal vias is an effective way to pull away heat from the device and into the system board. Concerns of solder voids and manufacturability problems can be addressed by the use of three basic tactics to minimize the amount of solder attach that will wick down the via barrel:

- Intentionally space out the vias from each other to avoid a cluster of holes in a given area.
- Use the smallest drill size allowed in your design. The example in Figure 21 uses vias with a 10 mil drill hole and a 26 mil capture pad.
- Tent the opposite side of the via with solder-mask.

In the end, the number and drill size of the thermal vias should align with the end user's PCB design rules and manufacturing capabilities.

Figure 21. Recommended PCB Layout (Top Down View)

(1) Keong W. Kam, David Pommerenke, "EMI Analysis Methods for Synchronous Buck Converter EMI Root Cause Analysis", University of Missouri – Rolla

Sensing Performance

The integrated temperature sensing technology built in the driver of the CSD95372AQ5M produces an analog signal that is proportional to the temperature of the lead-frame of the device, which is almost identical to the junction temperature of the Sync FET. To calculate the junction temperature based on the TAO voltage, use [Equation 2](#) below. TAO should be bypassed to P_{GND} with a 1nF X7R ceramic capacitor for optimal performance. The TAO pin has limited sinking current capability in order to enable several power stages that are wire OR-ed together to report only the highest temperature (or fault condition if present). In order to ensure accurate temperature reporting, the TAO nets should be routed on a quiet inner layer between ground planes where possible. In addition, the TAO bypass capacitor should have a P_{GND} pour on the layer directly beneath to ensure proper decoupling. The TAO net should always be shielded from V_{SW} and V_{IN} whenever possible.

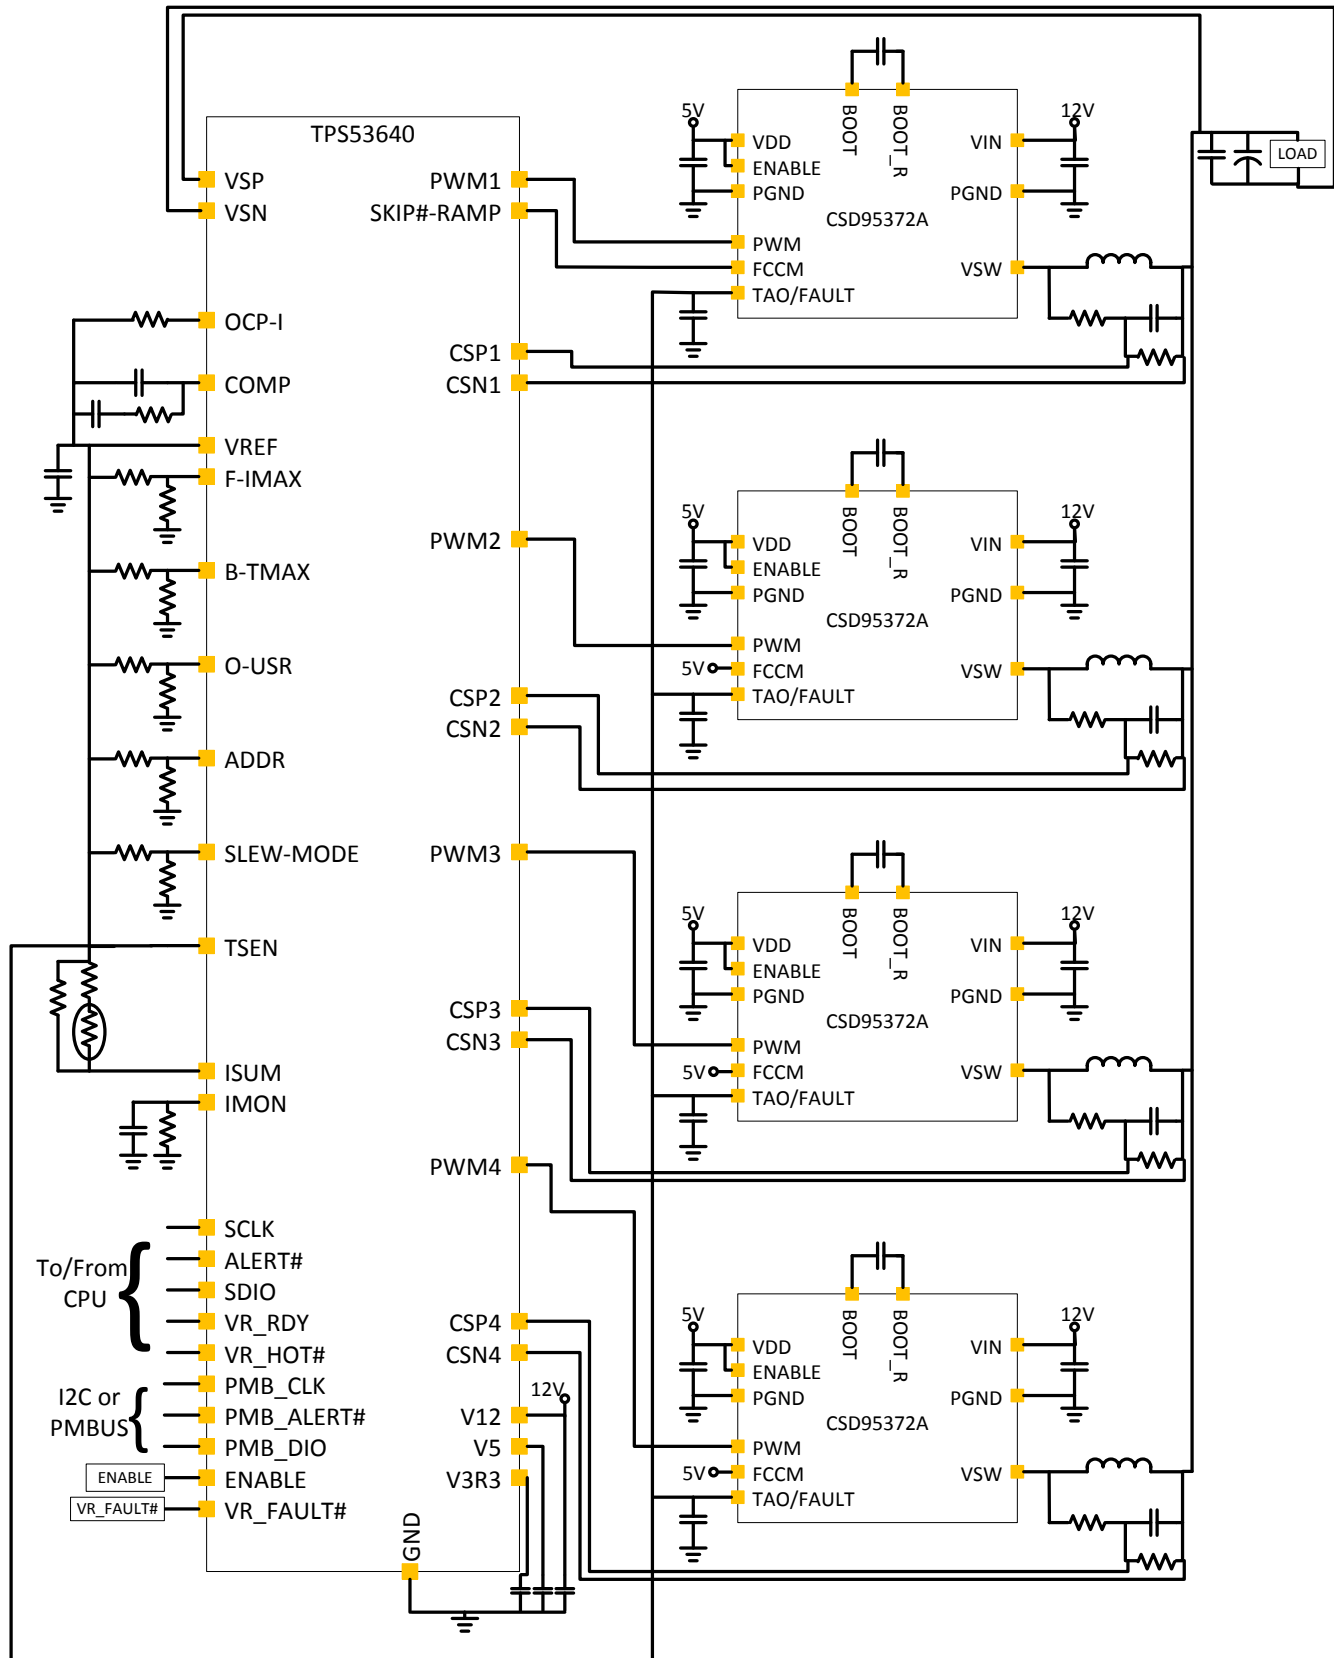

$$T_J[^\circ\text{C}] = (\text{TAO}[\text{mV}] - 400[\text{mV}]) / 8[\text{mV}/^\circ\text{C}] \quad (2)$$

CSD95372AQ5M

SLPS416A – JUNE 2013 – REVISED SEPTEMBER 2013

Recommended PCB Land Pattern

Recommended Stencil Opening

1. Dimensions are in mm (inches).
2. Stencil Thickness 100 μm

REVISION HISTORY

Changes from Original (June 2013) to Revision A

Page

- Changed CSD97372AQ5M to CSD95372AQ5M throughout the FUNCTIONAL DESCRIPTION section 8

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
CSD95372AQ5M	ACTIVE	SON	DQP	12	2500	Pb-Free (RoHS Exempt)	CU NIPDAU	Level-2-260C-1 YEAR	-50 to 150	95372AM	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

*All dimensions are nominal

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
