

# DS100BR210 Ultra Low Power 10.3 Gbps 2-Channel Repeater with Input Equalization and Output De-Emphasis

Check for Samples: [DS100BR210](#)

## FEATURES

- **Two channel repeater for up to 10.3 Gbps**
  - **DS100BR210 : 2x unidirectional channels**
  - **DS100BR111 : 1x bidirectional lane**
- **10G-KR bi-directional interface compatibility**
  - **Allows for back-channel communication and training**
- **Low 65mW/channel (typical) power consumption, with option to power down unused channels**
- **Advanced signal conditioning features**
  - **Receive equalization up to +36 dB**
  - **Transmit de-emphasis up to -12 dB**
  - **Transmit VOD control: 700 to 1200 mVp-p**
  - **< 0.3 UI of residual DJ at 10 Gbps**
- **Programmable via pin selection, EEPROM or SMBus interface**
- **Single supply operation selectable: 2.5V or 3.3v**
- **Flow-thru pinout in 4mmx4mm 24-pin leadless WQFN package**
- **>5kV HBM ESD rating**
- **Industrial -40 to 85°C operating temperature range**

## APPLICATIONS

- **High-speed active copper cable modules and FR-4 backplane in communication systems**
- **10GE, 10G-KR, FC, SAS, SATA 3/6 Gbps (with OOB detection), InfiniBand, CPRI, RXAUI and many others.**

## DESCRIPTION

The DS100BR210 is an extremely low power, high performance dual-channel repeater for serial links with data rates up to 10.3 Gbps. The DS100BR210 is configured as two unidirectional channels.

The DS100BR210 inputs feature a powerful 4-stage continuous time linear equalizer (CTLE) to provide a boost of up to +36 dB at 5 GHz and open an input eye that is completely closed due to inter-symbol interference (ISI) induced by the interconnect mediums such as an FR-4 backplane or AWG-30 cables. The transmitter features a programmable output de-emphasis driver with up to -12 dB and allows amplitude voltage levels to be selected from 700 mVp-p to 1200 mVp-p to suit multiple application scenarios.

When configured as a 10G-KR repeater, the DS100BR210 allows the KR host and the end point to optimize the full link by adjusting transmit and receive equalizer coefficients using back-channel communication techniques specified by the 802.3ap standard.

The programmable settings can be applied via pin control, SMBus (I2C) protocol or an external EEPROM. When operating in the EEPROM mode, the configuration information is automatically loaded on power up – This eliminates the need for an external microprocessor or software driver.

Part of TI's PowerWise family of energy efficient devices, the DS100BR210 consumes just 65 mW/channel (typical), and allows the option to turn-off unused channels. This ultra low power consumption eliminates the need for external heat sinks and simplifies thermal management in active cable applications.

## Typical Application

## Block Diagram - Detail View Of Channel (1 Of 2)

## Pin Diagram

The center DAP on the package bottom is the device GND connection. This pad must be connected to GND through multiple (minimum of 4) vias to ensure optimal electrical and thermal performance.

**Figure 1. DS100BR210 Pin Diagram 24 Lead**

**PRODUCT PREVIEW**

**Pin Descriptions<sup>(1)(2)</sup>**

Pin Name	Pin Number	I/O, Type	Pin Descriptions
<b>Differential High Speed I/O's</b>			
INA+, INA-, INB+, INB-,	7, 8 11, 12	I, CML	Inverting and non-inverting CML differential inputs to the equalizer. A on-chip 50Ω termination resistor connects INx+ to VDD and INx- to VDD when enabled.
OUTA+, OUTA-, OUTB+, OUTB-,	24, 23 20, 19	O, CML	Inverting and non-inverting 50Ω driver outputs with de-emphasis. Compatible with AC coupled CML inputs.
<b>Control Pins</b>			
ENSMB	3	I, LVCMOS Float	System Management Bus (SMBus) enable pin Tie HIGH = Register Access, SMBus Slave mode FLOAT = SMBus Master read from External EEPROM Tie LOW = External Pin Control Mode
ENSMB = 1 (SMBUS MODE)			
SCL	5	I, LVCMOS O, Open Drain	ENSMB Master or Slave mode SMBus clock input pin is enabled. A clock input in Slave mode. Can also be a clock output in Master mode.
SDA	4	I, LVCMOS, O, Open Drain	ENSMB Master or Slave mode The SMBus bidirectional SDA pin is enabled. Data input or open drain (pull-down only) output.
AD0-AD3	10, 9, 2, 1	I, LVCMOS, Float (4-Levels)	ENSMB Master or Slave mode SMBus Slave Address Inputs. In SMBus mode, these pins are the user set SMBus slave address inputs. There are 16 addresses supported by these pins. Pins must be tied LOW or HIGH when used to define the device SMBus address. <sup>(3)</sup>
READEN#	17	I, LVCMOS	When using an External EEPROM, a transition from high to low starts the load from the external EEPROM
DONE#	18	IO, LVCMOS, Float (4-Levels)	EEPROM Download Status HIGH indicates Error / Still Loading LOW indicates download complete. No Error.
ENSMB = 0 (PIN MODE)			
EQA0, EQA1 EQB0, EQB1	10, 9 1, 2	I, LVCMOS, Float (4-Levels)	EQA/B ,0/1 control the level of equalization of each channel. The EQA/B pins are active only when ENSMB is de-asserted (LOW). When ENSMB goes high the SMBus registers provide independent control of each lane, and the EQB0/B1 pins are converted to SMBUS AD2/AD3 inputs. <a href="#">Table 2</a>
DEMA, DEMB	4, 5	IO, LVCMOS, Float (4-Levels)	DEMA/B controls the level of de-emphasis. The DEMA/B pins are only active when ENSMB is de-asserted (LOW). The default SMBus setting is -3.5 dB. Each of the 4 A/B channels have the same level unless controlled by the SMBus control registers. When ENSMB goes high the SMBus registers provide independent control of each lane and the DEM pins are converted to SMBUS SCL and SDA pins. <a href="#">Table 3</a>
TX_DIS	6	I, LVCMOS	DS100BR210 High = OUTA/B Disabled Low = OUTA/B Enabled
VOD_SEL	17	I, LVCMOS, Float (4-Levels)	EQ Mode and VOD select. High = 10G-KR Mode (VOD = 1.1V/1.3V) Float = (VOD = 1.0 V) 20K = (VOD = 1.2 V) Low = (VOD = 700m V) <sup>(3)</sup>
VDD_SEL	16	I, Internal Pull-up	Enables the 3.3V to 2.5V internal regulator Low = 3.3 V Operation Float = 2.5 V Operation

(1) Input edge rate for LVCMOS/FLOAT inputs must be faster than 50 ns from 10–90%.

(2) LVCMOS inputs without the "Float" conditions must be driven to a logic low or high at all times or operation is not guaranteed. Unless the "Float" level is desired; 4-Level input pins require a minimum 1K resistor to GND, VDD (in 2.5V mode), or VIN (in 3.3V mode). For Additional information. [Table 1 Table 5](#)

(3) Setting VOD\_SEL = High in SMBus Mode will force the SMBus Address = B0'h

**Pin Descriptions<sup>(1)(2)</sup> (continued)**

Pin Name	Pin Number	I/O, Type	Pin Descriptions
MODE	18	I, LVCMOS, Float (4-Levels)	Controls Device Mode of Operation High = Continuous Talk (no output IDLE) Float = 10G-KR Mode, Slow OOB 20KΩ = eSATA Mode, Fast OOB, Auto Low Power on 100 uS of inactivity. SD stays active. Low = SAS Mode, Fast OOB
<b>Status Output</b>			
LOS	13	O, Open Drain	When HIGH, indicates Loss of Signal (Default is LOS on INA). Can be modified via SMBus registers.
<b>LOS Threshold Input</b>			
SD_TH	14	I, LVCMOS, Float (4-Levels)	The SD_TH pin controls LOS threshold setting; Assert (mV), Deassert (mV) 20K = 160 mV, 100 mV Float = 180 mV, 110 mV (Default) High = 190 mV, 130 mV Low = 210 mV, 150 mV <sup>(4)</sup>
<b>Power</b>			
VDD	21, 22	Power	Power supply pins 2.5V mode connect to 2.5V 3.3V mode do not connect to any supply voltage. Should be used to attach external decoupling to device, 100 - 200 nF recommended. See <a href="#">Applications Information</a> section for additional information.
VIN	15	Power	VIN = 3.3V +/-10% (input to internal LDO regulator) <sup>(5)</sup> See <a href="#">Applications Information</a> section for additional information.
GND	DAP	Power	Ground pad (DAP - die attach pad).

(4) Using values less than the default level can extend the time required to detect LOS and are not recommended.

(5) Must FLOAT for 2.5V operation.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

**Absolute Maximum Ratings** <sup>(1)</sup>

Supply Voltage (VDD)		-0.5V to +2.75V
Supply Voltage (VIN)		-0.5V to +4.0V
LVCMOS Input/Output Voltage		-0.5V to +4.0V
CML Input Voltage		-0.5V to (VDD+0.5)
CML Input Current		-30 to +30 mA
Junction Temperature		125°C
Storage Temperature		-40°C to +125°C
ESD Rating	HBM, STD - JESD22-A114F	> 5 kV
	MM, STD - JESD22-A115-A	100 V
	CDM, STD - JESD22-C101-D	1250 V
Package Thermal Resistance	θJC	3.2°C/W
	θJA, No Airflow, 4 layer JEDEC	33.0°C/W
For soldering specifications: See product folder at <a href="http://www.ti.com">www.ti.com</a> <a href="http://www.ti.com/lit/SNOA549">http://www.ti.com/lit/SNOA549</a>		

- (1) "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied.

**Recommended Operating Conditions** <sup>(1)</sup>

	Min	Typ	Max	Units
Supply Voltage (2.5V mode)	2.375	2.5	2.625	V
Supply Voltage (3.3V mode)	3.0	3.3	3.6	V
Ambient Temperature	-40	25	+85	°C
SMBus (SDA, SCL)			3.6	V

- (1) The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions. Absolute Maximum Numbers are guaranteed for a junction temperature range of -40°C to +125°C. Models are validated to Maximum Operating Voltages only.

**Electrical Characteristics**

Parameter		Test Conditions	Min	Typ	Max	Units
Power Supply Current						
IDD	Supply Current	TX_DIS = LOW, EQ = ON VOD_SEL = Float ( 1000 mV)		50	63	mA
		Auto Low Power Mode TX_DIS = LOW, MODE = 20K VID_CHA and CHB = 0.0V VOD_SEL = Float (1000 mV)		12	15	
		TX_DIS = HIGH (BR210)		12	15	
LVCMOS DC Specifications						
V <sub>IH</sub>	High Level Input Voltage		2.0		VDD	V
V <sub>IL</sub>	Low Level Input Voltage		GND		0.7	V
V <sub>OH</sub>	High Level Output Voltage	I <sub>OH</sub> = -4.0 mA <sup>(1)</sup>	2.0			V
V <sub>OL</sub>	Low Level Output Voltage	I <sub>OL</sub> = 4.0 mA			0.4	V
I <sub>IN</sub>	Input Leakage Current SCL and SDA	V <sub>input</sub> = 0V or VDD VDD_SEL = Float	-15		+15	uA
		V <sub>input</sub> = 0V or VIN VDD_SEL = Low	-15		+15	

- (1) V<sub>OH</sub> only applies to the DONE# pin; LOS, SCL, and SDA are open-drain outputs that have no internal pull-up capability. DONE# is a full LVCMOS output with pull-up and pull-down capability

(6) Typical jitter reported is determined by jitter decomposition software on the DSA8200 Oscilloscope.

## Electrical Characteristics — Serial Management Bus Interface

Over recommended operating supply and temperature ranges unless other specified.

Parameter		Test Conditions	Min	Typ	Max	Units
Serial Bus Interface DC Specifications: <sup>(1)</sup>						
V <sub>IL</sub>	Data, Clock Input Low Voltage				0.8	V
V <sub>IH</sub>	Data, Clock Input High Voltage		2.1		3.6	V
I <sub>PULLUP</sub>	Current Through Pull-Up Resistor or Current Source	High Power Specification	4			mA
V <sub>DD</sub>	Nominal Bus Voltage		2.375		3.6	V
I <sub>LEAK-Bus</sub>	Input Leakage Per Bus Segment	<sup>(2)</sup>	-200		+200	μA
C <sub>I</sub>	Capacitance for SDA and SCL	See <sup>(2)</sup> <sup>(3)</sup> <sup>(4)</sup>			10	pF
R <sub>TERM</sub>	External Termination Resistance pull to V <sub>DD</sub> = 2.5V ± 5% OR 3.3V ± 10%	Pullup V <sub>DD</sub> = 3.3V, <sup>(2)</sup> <sup>(3)</sup> <sup>(5)</sup>		2000		Ω
		Pullup V <sub>DD</sub> = 2.5V, <sup>(2)</sup> <sup>(3)</sup> <sup>(5)</sup>		1000		Ω
Serial Bus Interface Timing Specifications						
FSMB	Bus Operating Frequency	ENSMB = VDD (Slave Mode)			400	kHz
		ENSMB = FLOAT (Master Mode) <sup>(1)</sup>	280	400	520	kHz
TBUF	Bus Free Time Between Stop and Start Condition		1.3			μs
THD:STA	Hold time after (Repeated) Start Condition. After this period, the first clock is generated.	At I <sub>PULLUP</sub> , Max	0.6			μs
TSU:STA	Repeated Start Condition Setup Time		0.6			μs
TSU:STO	Stop Condition Setup Time		0.6			μs
THD:DAT	Data Hold Time		0			ns
TSU:DAT	Data Setup Time		100			ns
T <sub>LOW</sub>	Clock Low Period		1.3			μs
T <sub>HIGH</sub>	Clock High Period	See <sup>(6)</sup>	0.6		50	μs
t <sub>F</sub>	Clock/Data Fall Time	See <sup>(6)</sup>			300	ns
t <sub>R</sub>	Clock/Data Rise Time	See <sup>(6)</sup>			300	ns
t <sub>POR</sub>	Time in which a device must be operational after power-on reset	See <sup>(6)</sup> <sup>(4)</sup>			500	ms

(1) EEPROM interface requires 400 KHz capable EEPROM device.

(2) Recommended value.

(3) Recommended maximum capacitance load per bus segment is 400pF.

(4) Guaranteed by Design and/or characterization. Parameter not tested in production.

(5) Maximum termination voltage should be identical to the device supply voltage.

(6) Compliant to SMBus 2.0 physical layer specification. See System Management Bus (SMBus) Specification Version 2.0, section 3.1.1 SMBus common AC specifications for details.

## TIMING DIAGRAMS

**Figure 3. Propagation Delay Timing Diagram**

**Figure 4. Idle Timing Diagram**

**Figure 5. SMBus Timing Parameters**

## FUNCTIONAL DESCRIPTION

The DS100BR210 is a high performance circuit capable of delivering excellent performance. Careful attention must be paid to the details associated with high-speed design as well as providing a clean power supply. Refer to the information below and Revision 4 of the LVDS Owner's Manual for more detailed information on high speed design tips to address signal integrity design issues.

The control pins have been enhanced to have 4 different levels and provide a wider range of control settings. Refer to [Table 1](#)

**Table 1. 4-Level Control Pin Settings**

Pin Setting	Description
0	Tie pin to GND through a 1 K $\Omega$ resistor
R	Tie pin to ground through 20 K $\Omega$ resistor
Float	Float the pin (no connection)
1	Tie pin to VDD through a 1 K $\Omega$ resistor

### NOTE

4-Level IO pins require a 1K resistance to GND or VDD/VIN. It is possible to tie multiple 4-level IO pins together with a single resistor to GND or VDD/VIN. When multiple IOs are connected in parallel, the resistance to GND or VDD/VIN should be adjusted to compensate. For 2 pins the optimal resistance is 500 Ohms, 3 pins = 330 Ohms, and 4 pins = 250 Ohms.

### NOTE

For 2.5V mode the control pin logic 1 level is VDD (pins 21 and 22), in 3.3V mode the control pin logic 1 level is defined by VIN (pin 15).

**Table 2. Equalizer Settings**

Level	EQA1/EQ B1	EQA0/EQB0	EQ — 8 bits [7:0]	dB Boost at 5 Ghz	Suggested Media
1	0	0	0000 0000 = 0x00	2.5	FR4 < 5 inch trace
2	0	R	0000 0001 = 0x01	6.5	FR4 5 inch trace
3	0	Float	0000 0010 = 0x02	9	FR4 10 inch trace
4	0	1	0000 0011 = 0x03	11.5	FR4 15 inch trace
5	R	0	0000 0111 = 0x07	14	FR4 20 inch trace
6	R	R	0001 0101 = 0x15	15	FR4 25 inch trace
7	R	Float	0000 1011 = 0x0B	17	FR4 25 inch trace
8	R	1	0000 1111 = 0x0F	19	7m 30AWG Cable

10	Float	R	0001 1111 = 0x1F	23	8m 30 AWG Cable FR4 35 inch trace
11	Float	Float	0010 1111 = 0x2F	25	10m 30 AWG Cable
12	Float	1	0011 1111 = 0x3F	27	10m - 12m, Cable
13	1	0	1010 1010 = 0xAA	30	
14	1	R	0111 1111 = 0x7F	31	
15	1	Float	1011 1111 = 0xBF	33	
16	1	1	1111 1111 = 0xFF	34	

**NOTE**

Settings are approximate and will change based on PCB material, trace dimensions, and driver waveform characteristics.

**Table 3. De-emphasis and Output Voltage Settings**

Level	VOD_SEL	DEMA/B	SMBus Register DEM Level	SMBus Register VOD Level	VOD (mV)	DEM (dB)
1	0	0	000	000	700	0
2	0	Float	010	000	700	- 3.5
3	0	R	011	000	700	- 6
4	0	1	101	000	700	- 9
5	Float	0	000	011	1000	0
6	Float	Float	010	011	1000	- 3.5
7	Float	R	011	011	1000	- 6
8	Float	1	101	011	1000	- 9
9	R	0	000	101	1200	- 0
10	R	Float	010	101	1200	- 3.5
11	R	R	011	101	1200	- 6
12	R	1	101	101	1200	- 9
13	1	0	000	100	1100	0
14	1	Float	001	110	1300	- 1.5
15	1	R	001	100	1100	- 1.5
16	1	1	010	110	1300	- 3.5

**NOTE**

When VOD\_SEL is in the Logic 1 state (1K resistor to VIN/VDD) the DS100BR210 will support 10G-KR back-channel communication using pin control.

**NOTE**

In SMBus Mode if VOD\_SEL is in the Logic 1 state (1K resistor to VIN/VDD) the DS100BR210 AD0-AD3 pins are internally forced to 0'h.

**Table 4. Signal Detect Threshold Level<sup>(1)</sup>**

SD_TH	SMBus REG bit [3:2] and [1:0]	Assert Level (Typical)	De-assert Level (Typical)
0	10	210 mV	150 mV
20K to GND	01	160 mV	100 mV
Float (Default)	00	180 mV	110 mV
1	11	190 mV	130 mV

(1) VDD = 2.5V, 25°C, and 010101 pattern at 10 Gbps

## APPLICATIONS INFORMATION

### 4-Level Input Configuration Guidelines

The 4-level input pins utilize a resistor divider to help set the 4 valid levels. There is an internal 30K pull-up and a 60K pull-down connected to the package pin. These resistors, together with the external resistor connection combine to achieve the desired voltage level. Using the 1K pull-up, 1K pull-down, no connect, and 20K pull-down provide the optimal voltage levels for each of the four input states.

**Table 5. 4-Level Input Voltage**

Level	Setting	3.3V Mode	2.5V Mode
0	01K to GND	0.1 V	0.08 V
R	20K to GND	$0.33 * V_{IN}$	$0.33 * V_{DD}$
F	FLOAT	$0.67 * V_{IN}$	$0.67 * V_{DD}$
1	1K to $V_{DD}/V_{IN}$	$V_{IN} - 0.05V$	$V_{IN} - 0.04V$

- Typical 4-Level Input Thresholds
  - Level 1 - 2 =  $0.2 V_{IN}$  or  $V_{DD}$
  - Level 2 - 3 =  $0.5 V_{IN}$  or  $V_{DD}$
  - Level 3 - 4 =  $0.8 V_{IN}$  or  $V_{DD}$

In order to minimize the startup current associated with the integrated 2.5V regulator the 1K pull-up / pull-down resistors are recommended. If several 4 level inputs require the same setting, it is possible to combine two or more 1K resistors into a single lower value resistor. As an example; combining two inputs with a single 500Ω resistor is a good way to save board space.

### 10G-KR Configuration Guidelines

When configured in "KR Mode", using either the VOD\_SEL pin setting or SMBus register control, the DS100BR210 is designed to operate transparently within a KR backplane channel environment. Installing a DS100 repeater within the KR backplane channel splits the total channel attenuation into two parts. Ideally the repeater can be placed near the middle of the channel maximizing the signal to noise ratio across the bidirectional interface.

In order to maximize the 10G-KR solution space, the 802.3ap specification calls for an optimization of the transmit signal conditioning coefficients based on feedback for the KR receiver. Setting the DS100BR210 active CTLE to compensate for the channel loss from each of the KR transmitters will reduce the transmit and receive equalization settings required on the KR physical layer devices. This central location keeps a larger S/N ratio at all points in the channel, extending the available solution space and increasing the overall margin of almost any channel.

### PCB Layout Guidelines

The CML inputs and outputs have been optimized to work with interconnects using a controlled differential impedance of 85 - 100Ω. It is preferable to route differential lines exclusively on one layer of the board, particularly for the input traces. The use of vias should be avoided if possible. If vias must be used, they should be used sparingly and must be placed symmetrically for each side of a given differential pair. Whenever differential vias are used the layout must also provide for a low inductance path for the return currents as well. Route the differential signals away from other signals and noise sources on the printed circuit board. See [SNOA401Q AN-1187](#) for additional information on WQFN packages.

Different transmission line topologies can be used in various combinations to achieve the optimal system performance. Impedance discontinuities at vias can be minimized or eliminated by increasing the swell around each hole and providing for a low inductance return current path. When the via structure is associated with thick backplane PCB, further optimization such as back drilling is often used to reduce the detrimental high frequency effects of stubs on the signal path.

## Power Supply Configuration Guidelines

The DS100BR210 can be configured for 2.5V operation or 3.3V operation. The lists below outline required connections for each supply selection.

### 3.3V Mode of Operation

1. Tie VDD\_SEL = 0 with 1K resistor to GND.
2. Feed 3.3V supply into VIN pin. Local 1.0  $\mu$ F decoupling at VIN is recommended.
3. See information on VDD bypass below.
4. SDA and SCL pins should connect pull-up resistor to VIN
5. Any 4-Level input which requires a connection to "Logic 1" should use a 1K resistor to VIN

### 2.5V Mode of Operation

6. VDD\_SEL = Float
7. VIN = Float
8. Feed 2.5V supply into VDD pins.
9. See information on VDD bypass below.
10. SDA and SCL pins connect pull-up resistor to VDD for 2.5V uC SMBus IO
11. SDA and SCL pins connect pull-up resistor to 3.3V for 3.3V uC SMBus IO
12. Any 4-Level input which requires a connection to "Logic 1" should use a 1K resistor to VDD

---

### NOTE

The DAP (bottom solder pad) is the GND connection.

---

## Power Supply Bypass

Two approaches are recommended to ensure that the DS100BR210 is provided with an adequate power supply. First, the supply (VDD) and ground (GND) pins should be connected to power planes routed on adjacent layers of the printed circuit board. The layer thickness of the dielectric should be minimized so that the  $V_{DD}$  and GND planes create a low inductance supply with distributed capacitance. Second, careful attention to supply bypassing through the proper use of bypass capacitors is required. A 0.1  $\mu$ F bypass capacitor should be connected to each  $V_{DD}$  pin such that the capacitor is placed as close as possible to the device. Smaller body size capacitors can help facilitate proper component placement.

### System Management Bus (SMBus) and Configuration Registers

The System Management Bus interface is compatible to SMBus 2.0 physical layer specification. ENSMB must be pulled high to enable SMBus mode and allow access to the configuration registers.

The DS100BR210 has AD[3:0] inputs in SMBus mode. These pins are the user set SMBus slave address inputs. When pulled low the AD[3:0] = 0000'b, the device default address byte is B0'h. Based on the SMBus 2.0 specification, this configuration results in a 7-bit slave address of 1011000'b. The LSB is set to 0'b (for a WRITE), thus the 8-bit value is 1011 0000'b or B0'h. The device address byte can be set with the use of the AD[3:0] inputs.

Shown in the form of an expression:

Slave Address [7:4] = The DS100BR210 hardware address (1011'b) + Address pin AD[3]

Slave Address [3:1] = Address pins AD[2:0]

Slave Address [0] = 0'b for a WRITE or 1'b for a READ

Slave Address Examples:

- AD[3:0] = 0001'b, the device slave address byte is B2'h
  - Slave Address [7:4] = 1011'b + 0'b = 1011'b or B'h
  - Slave Address [3:1] = 001'b
  - Slave Address [0] = 0'b for a WRITE
- AD[3:0] = 0010'b, the device slave address byte is B4'h
  - Slave Address [7:4] = 1011'b + 0'b = 1011'b or B'h
  - Slave Address [3:1] = 010'b
  - Slave Address [0] = 0'b for a WRITE
- AD[3:0] = 0100'b, the device slave address byte is B8'h
  - Slave Address [7:4] = 1011'b + 0'b = 1011'b or B'h
  - Slave Address [3:1] = 100'b
  - Slave Address [0] = 0'b for a WRITE
- AD[3:0] = 1000'b, the device slave address byte is C0'h
  - Slave Address [7:4] = 1011'b + 1'b = 1100'b or C'h
  - Slave Address [3:1] = 000'b
  - Slave Address [0] = 0'b for a WRITE

## TRANSFER OF DATA VIA THE SMBus

During normal operation the data on SDA must be stable during the time when SCL is High.

There are three unique states for the SMBus:

**START:** A High-to-Low transition on SDA while SCL is High indicates a message START condition.

**STOP:** A Low-to-High transition on SDA while SCL is High indicates a message STOP condition.

**IDLE:** If SCL and SDA are both High for a time exceeding  $t_{BUF}$  from the last detected STOP condition or if they are High for a total exceeding the maximum specification for  $t_{HIGH}$  then the bus will transfer to the IDLE state.

## SMBus TRANSACTIONS

The device supports WRITE and READ transactions. See [Table 9](#) for register address, type (Read/Write, Read Only), default value and function information.

### WRITING A REGISTER

To write a register, the following protocol is used (see SMBus 2.0 specification).

1. The Host drives a START condition, the 7-bit SMBus address, and a “0” indicating a WRITE.
2. The Device (Slave) drives the ACK bit (“0”).
3. The Host drives the 8-bit Register Address.
4. The Device drives an ACK bit (“0”).
5. The Host drive the 8-bit data byte.
6. The Device drives an ACK bit (“0”).
7. The Host drives a STOP condition.

The WRITE transaction is completed, the bus goes IDLE and communication with other SMBus devices may now occur.

### READING A REGISTER

To read a register, the following protocol is used (see SMBus 2.0 specification).

1. The Host drives a START condition, the 7-bit SMBus address, and a “0” indicating a WRITE.
2. The Device (Slave) drives the ACK bit (“0”).
3. The Host drives the 8-bit Register Address.
4. The Device drives an ACK bit (“0”).
5. The Host drives a START condition.
6. The Host drives the 7-bit SMBus Address, and a “1” indicating a READ.
7. The Device drives an ACK bit “0”.
8. The Device drives the 8-bit data value (register contents).
9. The Host drives a NACK bit “1” indicating end of the READ transfer.
10. The Host drives a STOP condition.

The READ transaction is completed, the bus goes IDLE and communication with other SMBus devices may now occur.

Please see [Table 9](#) for more information.

Figure 6. Typical SMBus Write Operation

### EEPROM Modes in the DS100BR210

The DS100BR210 device supports reading directly from an external EEPROM device by implementing SMBus Master mode. When using the SMBus master mode, the DS100 will read directly from specific location in the external EEPROM. When designing a system for using the external EEPROM, the user needs to follow these specific guidelines.

- Set the DS100BR210 into SMBus Master Mode
  - Float ENSMB (PIN 3)
- The external EEPROM device must support 400 KHz operation
- The external EEPROM device address byte must be 0xA0'h
- Set the AD[3:0] inputs for SMBus address byte. When the AD[3:0] = 0000'b, the device address byte is B0'h.
- Based on the SMBus 2.0 specification, a device can have a 7-bit slave address of 1010 000'b. The LSB is set to 0'b (for a WRITE). The bit mapping for SMBus is listed below:
  - [7:5] = Reserved Bits from the SMBus specification
  - [4:1] = Usable SMBus Address Bits
  - [0] = Write Bit
- The DS100BR210 device has AD[3:0] inputs in SMBus mode (pins 1, 2, 9, 10). These pins set SMBus slave address. When the AD[3:0] = 0001'b, the device address byte is B2'h.
  - [7:5] = Default to 3b'101
  - [4:1] = Address of 4'b0001
  - [0] = Write Bit, 1'b0
- The device address can be set with the use of the AD[3:0] input up to 16 different addresses. Use the example below to set each of the SMBus addresses.
  - AD[3:0] = 0001'b, the device address byte is B2'h
  - AD[3:0] = 0010'b, the device address byte is B4'h
  - AD[3:0] = 0011'b, the device address byte is B6'h
  - AD[3:0] = 0100'b, the device address byte is B8'h
- The master implementation in the DS100BR210, supports multiple devices reading from 1 EEPROM. When tying multiple devices to the SDA and SCL pins, use these guidelines:
  - Use adjacent SMBus addresses for the 4 devices
  - Use a pull-up resistor on SDA; value = 4.7KΩ
  - Use a pull-up resistor on SCL; value = 4.7KΩ
  - Daisy-chain READEN# (pin 17) and DONE# (pin18) from one device to the next device in the sequence
    1. Tie READEN# of the 1st device in the chain (U1) to GND
    2. Tie DONE# of U1 to READEN# of U2
    3. Tie DONE# of U2 to READEN# of U3
    4. Tie DONE# of U3 to READEN# of U4
    5. Optional: Tie DONE# of U4 to a LED to show each of the devices have been loaded successfully

### Master EEPROM Mode in the DS100BR210

Below is an example of a 2 kbits (256 x 8-bit) EEPROM in hex format for the DS100BR210 device. The first 3 bytes of the EEPROM always contain a header common and necessary to control initialization of all devices connected to the I2C bus. CRC enable flag to enable/disable CRC checking. There is a MAP bit to flag the presence of an address map that specifies the configuration data start in the EEPROM. If the MAP bit is not present the configuration data start address is derived from the DS100BR210 address and the configuration data size. A bit to indicate an EEPROM size > 256 bytes is necessary to properly address the EEPROM. There are 37 bytes of data size for each DS100BR210 device.

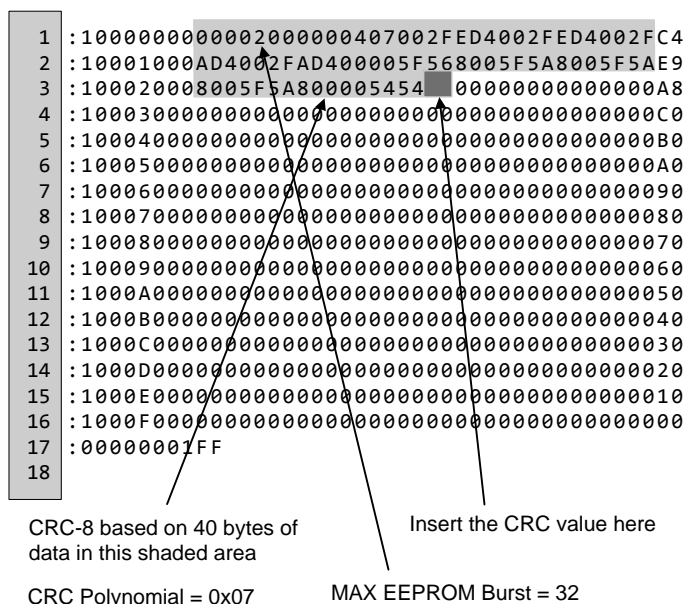

Figure 7. Typical EEPROM Data Set

The CRC-8 calculation is performed on the first 3 bytes of header information plus the 37 bytes of data for the DS100BR210 or 40 bytes in total. The result of this calculation is placed immediately after the DS100BR210 data in the EEPROM which ends with "5454". The CRC-8 in the DS100BR210 uses a polynomial =  $x^8 + x^2 + x + 1$

In SMBus master mode the DS100BR210 reads its initial configuration from an external EEPROM upon power-up. Some of the pins of the DS100BR210 perform the same functions in SMBus master and SMBus slave mode. Once the DS100BR210 has finished reading its initial configuration from the external EEPROM in SMBus master mode it reverts to SMBus slave mode and can be further configured by an external controller over the SMBus. The connection to an external SMBus master is optional and can be omitted for applications where additional security is desirable. There are two pins that provide unique functions in SMBus master mode.

- DONE#
- READEN#

When the DS100BR210 is powered up in SMBus master mode, it reads its configuration from the external EEPROM when the READEN# pin goes low. When the DS100BR210 is finished reading its configuration from the external EEPROM, it drives the DONE# pin low. In applications where there is more than one DS100BR210 on the same SMBus, bus contention can result if more than one DS100BR210 tries to take control of the SMBus at the same time. The READEN# and DONE# pins prevent this bus contention. The system should be designed so that the READEN# pin from one DS100BR210 in the system is driven low on power-up. This DS100BR210 will take command of the SMBus on power-up and will read its initial configuration from the external EEPROM. When it is finished reading its configuration, it will drive the DONE# pin low. This pin should be connected to the READEN# pin of another DS100BR210. When this DS100BR210 senses its READEN# pin driven low, it will take command of the SMBus and read its initial configuration from the external EEPROM, after which it will set its DONE# pin low. By connecting the DONE# pin of each DS100BR210 to the READEN# pin of the next DS100BR210, each DS100BR210 can read its initial configuration from the EEPROM without causing bus contention.

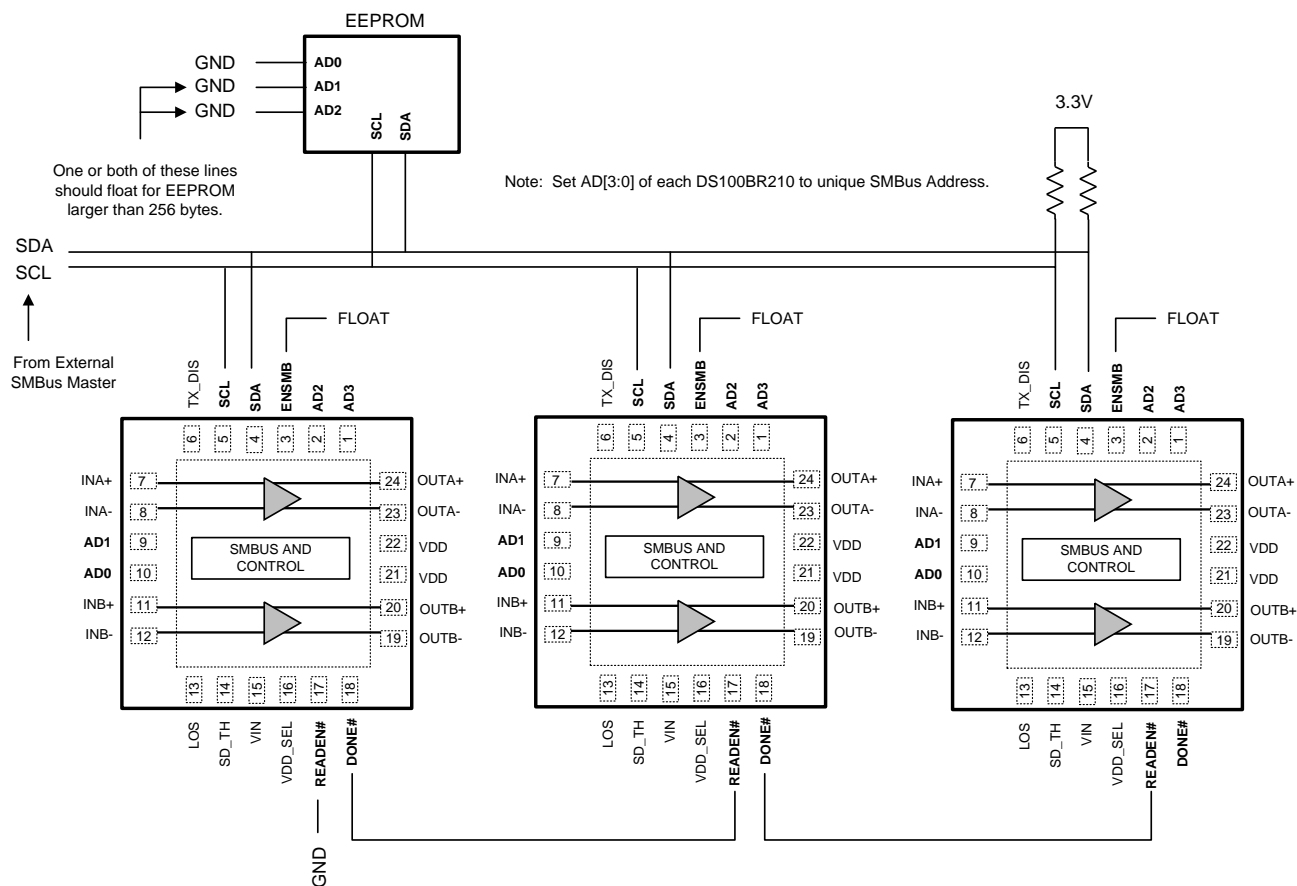

Figure 8. Typical multi-device EEPROM connection diagram

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples
DS100BR210SQ/NOPB	ACTIVE	WQFN	RTW	24	1000	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 85	BR210	<a href="#">Samples</a>
DS100BR210SQE/NOPB	ACTIVE	WQFN	RTW	24	250	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 85	BR210	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

### Products

Audio	<a href="http://www.ti.com/audio">www.ti.com/audio</a>
Amplifiers	<a href="http://amplifier.ti.com">amplifier.ti.com</a>
Data Converters	<a href="http://dataconverter.ti.com">dataconverter.ti.com</a>
DLP® Products	<a href="http://www.dlp.com">www.dlp.com</a>
DSP	<a href="http://dsp.ti.com">dsp.ti.com</a>
Clocks and Timers	<a href="http://www.ti.com/clocks">www.ti.com/clocks</a>
Interface	<a href="http://interface.ti.com">interface.ti.com</a>
Logic	<a href="http://logic.ti.com">logic.ti.com</a>
Power Mgmt	<a href="http://power.ti.com">power.ti.com</a>
Microcontrollers	<a href="http://microcontroller.ti.com">microcontroller.ti.com</a>
RFID	<a href="http://www.ti-rfid.com">www.ti-rfid.com</a>
