

### 4:1 Intermediate Bus Converter Module: Up to 650 W Output

Size:  
2.30 x 1.45 x 0.42 in  
58,4 x 36,8 x 10,6 mm

#### Applications

- Enterprise networks
- Optical access networks
- Storage networks
- Automated test equipment

#### Features

- Input: 36 – 60 Vdc
- Output: 12 Vdc at 48 Vin
- Output current: up to 53 A
- Output power: up to 650 W <sup>[A]</sup>
- 2,250 Vdc isolation
- 97.8% peak efficiency
- Low profile: 0.42" height above board
- Industry standard 1/4 Brick pinout
- Sine Amplitude Converter
- Low noise 1 MHz ZVS/ZCS

<sup>[A]</sup> For lower power applications see 300 W model IB050E120T32N1-00 or 500 W model IB050E120T40N1-00

#### Product Overview

The Intermediate Bus Converter (IBC) Module is a very efficient, low profile, isolated, fixed ratio converter for power system applications in enterprise and optical access networks. Rated at up to 477 W from 36 Vin and up to 650 W from 50 to 60 Vin, the IBC conforms to an industry standard quarter-brick footprint while supplying power greatly exceeding competitive quarter-bricks. Its leading efficiency enables full load operation at 55°C with only 200 LFM airflow. Its small cross section facilitates unimpeded airflow — above and below its thin body — to minimize the temperature rise of downstream components.

#### Absolute Maximum Ratings

	Min	Max	Unit	Notes
Input voltage (+In to –In)				
Operating	36	60	Vdc	
Non-operating		75	Vdc	<100 mS
Input voltage slew rate		5	V/μs	
EN to –IN	-0.5	20	Vdc	
Output voltage (+Out to –Out)	-0.5	17.2	Vdc	
Output current		53	A	Pout ≤ 650 W
Dielectric withstand (input to output)	2,250		Vdc	1 min.
Temperature				
Operating junction	-40	125	°C	Hottest Semiconductor
Storage	-55	125	°C	

## SPECIFICATIONS

All specifications valid at 48 V<sub>IN</sub>, 100% rated load and 25°C ambient, unless otherwise indicated.

## Electrical Characteristics

Attribute	Symbol	Conditions / Notes	Min	Typ	Max	Unit
<b>INPUT</b> (Operating from DC input source)						
Operating input voltage			36	48	60	Vdc
Non-operating input surge withstand		<100 mS			75	Vdc
Operating input dV/dt			0.003		5	V/us
Undervoltage protection						
Turn-on			31		36	Vdc
Turn-off			29		34	Vdc
Turn-on/Turn-off hysteresis			2			Vdc
Time constant					7	µs
Undervoltage blanking time		UV blanking time is enabled after startup	50	100	200	µs
Overvoltage protection						
Turn-off			65		69	Vdc
Turn-on			60		69	Vdc
Time constant					4	µs
Turn ON delay						
Start up inhibit		V <sub>IN</sub> reaching turn-on voltage to enable function operational, see Figure 6	20	25	30	ms
Turn-on delay		Enable to 10% V <sub>OUT</sub> ; pre-applied V <sub>IN</sub> , see Figure 7 0 load capacitance			50	µs
Output voltage rise time		From 10% to 90% V <sub>out</sub> , 10% load, 0 load capacitance			50	µs
Restart turn-on delay		See page 10 for restart after EN pin disable			250	ms
No Load power dissipation						
Enabled				4.0	5.5	W
Disabled				0.15	0.20	W
Input current					13.5	A
Inrush current overshoot		Using test circuit in Figure 21, 15% load, highline		13	18.9	A
Input reflected ripple current		At max power; Using test circuit in Figure 22			650	mArms
Peak short circuit input current					45	A
Repetitive short circuit peak current					25	A
Internal input capacitance				17.6		µF
Internal input inductance				5		nH
Recommended external input capacitance		200 nH maximum source inductance	47		470	µF
<b>OUTPUT</b>						
DC Output voltage band		No load, over Vin range	9.0	12.0	15.0	V
Output power [a]						
36-55 V <sub>IN</sub>			0		477	W
48-55 V <sub>IN</sub>			0		600	W
50-60 V <sub>IN</sub>			0		650	W
Output current		P ≤ 650 W			53	A
Output start up load		of I <sub>out</sub> max, maximum output capacitance			15	%
Effective output resistance				3.9		mΩ
Line regulation (K factor)		V <sub>OUT</sub> = K • V <sub>IN</sub> @ no load	0.245	0.250	0.252	
Current share accuracy		Full power operation; See Parallel Operation on page 11; up to 3 units			10	%

## SPECIFICATIONS (CONT.)

All specifications valid at 48 V<sub>IN</sub>, 100% rated load and 25°C ambient, unless otherwise indicated.

## Electrical Characteristics (Continued)

Attribute	Symbol	Conditions / Notes	Min	Typ	Max	Unit
<b>OUTPUT (Continued)</b>						
Efficiency						
50% load		See Figure 1,2 and 3	97.5	97.8		%
Full load		See Figure 1,2 and 3	97.0	97.3		%
Internal output inductance				1.6		nH
Internal output capacitance				75		μF
Load capacitance		Nominal load	0		3,000	μF
Output OVP set point		Module will shutdown	16.2		17.2	Vdc
Output voltage ripple		20 MHz bandwidth, using test circuit in Figure 23		60	150	mVp-p
Output Overload protection threshold		Of lout max., will not shutdown when started into max Cout; and 15% load Auto restart with duty cycle <10%	105		150	%
Over current protection time constant					1.2	ms
Short circuit current response time					1.5	μs
Switching frequency				1.0		MHz
Transient Response						
Voltage overshoot & undershoot		25% load step; 1A/μS; See Figures 11–14			100	mV
Response time		See Figures 11–14		1		μS
V <sub>IN</sub> step		5 V step in 1 μS within Vin operating range			1.25	V
Pre-bias voltage		Unit will start up into pre-bias voltage on output	0		15	Vdc

<sup>a)</sup> Does not exceed IPC-9592 derating guidelines. At 70°C ambient, full power operation may exceed IPC-9592 guidelines, but does not exceed component ratings, does not activate OTP and does not compromise reliability.

## General Characteristics

Conditions: 25°C case, 75% rated load and specified input voltage range unless otherwise specified.

Attribute	Symbol	Conditions / Notes	Min	Typ	Max	Unit
MTBF		Calculated per Telcordia SR-332, 40°C	1.0			Mhrs
Service life		Calculated at 30°C	7			Years
Over temperature shut down		T <sub>J</sub> ; Converter will reset when over temperature condition is removed	125	130	135	°C
Dielectric withstand		Input to output	2,250			Vdc
Insulation resistance		Input to output		30		MΩ
Mechanical						
Weight				1.38 / 39.1		oz/g
Length				2.30 / 58.4		in/mm
Width				1.45 / 36.8		in/mm
Height above customer board				0.41 / 10.5		in/mm
Pin Solderability		Storage life for normal solderability			1	Years
Moisture Sensitivity Level	MSL	Not applicable, for wave soldering only	N/A			
Clearance to customer board		From lowest component on IBC	0.12/0.30			in/mm
Agency approvals (pending for baseplate version)		UL/cUL 60950-1, EN60950-1, IEC60950-1 Low voltage directive (CE Mark)				
Altitude, operating		Derate operating temp 1°C per 1,000 feet above sea level	-500		10,000	Feet
Relative humidity, Operating		Non condensing	10		90	%
RoHS compliance		Compatible with RoHS directive 2002/95/EC

## PIN / CONTROL FUNCTIONS

### +In / -In – DC Voltage Input Pins

The IBC input voltage range should not be exceeded. An internal undervoltage/overvoltage lockout function prevents operation outside of the normal operating input range. The IBC turns on within an input voltage window bounded by the “Input under-voltage turn-on” and “Input over-voltage turn-off” levels, as specified. The IBC may be protected against accidental application of a reverse input voltage by the addition of a rectifier in series with the positive input, or a reverse rectifier in shunt with the positive input located on the load side of the input fuse.

The connection of the IBC to its power source should be implemented with minimal distribution inductance. If the interconnect inductance exceeds 100 nH, the input should be bypassed with a RC damper to retain low source impedance and stable operation. With an interconnect inductance of 200 nH, the RC damper may be 47  $\mu$ F in series with 0.3  $\Omega$ . A single electrolytic or equivalent low-Q capacitor may be used in place of the series RC bypass.

### EN - Enable/Disable

#### Negative Logic Option

If the EN port is left floating, the IBC output is disabled. Once this port is pulled lower than 0.8 Vdc with respect to –In, the output is enabled. The EN port can be driven by a relay, opto-coupler, or open collector transistor. Refer to Figures 6 and 7 for the typical enable / disable characteristics. This port should not be toggled at a rate higher than 1 Hz. The EN port should also not be driven by or pulled up to an external voltage source.

#### Positive Logic Option

If the EN port is left floating, the IBC output is enabled. Once this port is pulled lower than 1.4 Vdc with respect to –In, the output is disabled. This action can be realized by employing a relay, opto-coupler, or open collector transistor. This port should not be toggled at a rate higher than 1 Hz.

The EN port should also not be driven by or pulled up to an external voltage source. The EN port can source up to 2 mA at 5 Vdc. The EN port should never be used to sink current.

If the IBC is disabled using the EN pin, the module will attempt to restart approximately every 250ms. Once the module has been disabled for at least 250ms, the turn on delay after the EN pin is enabled will be as shown in Figure 7.

### +Out / -Out – DC Voltage Output Pins

Total load capacitance at the output of the IBC should not exceed the specified maximum. Owing to the wide bandwidth and low output impedance of the IBC, low frequency bypass capacitance and significant energy storage may be more densely and efficiently provided by adding capacitance at the input of the IBC.

Figure 30 — IBC Pin Designations

## APPLICATIONS NOTE

### Parallel Operation

The IBC will inherently current share when operated in an array. Arrays may be used for higher power or redundancy in an application. Current sharing accuracy is maximized when the source and load impedance presented to each IBC within an array are equal. The recommended method to achieve matched impedances is to dedicate common copper planes within the PCB to deliver and return the current to the array, rather than rely upon traces of varying lengths. In typical applications the current being delivered to the load is larger than that sourced from the input, allowing narrower traces to be utilized on the input side if necessary. The use of dedicated power planes is, however, preferable.

One or more IBCs in an array may be disabled without adversely affecting operation or reliability as long as the load does not exceed the rated power of the enabled IBCs.

The IBC power train and control architecture allow bi-directional power transfer, including reverse power processing from the IBC output to its input. The IBC's ability to process power in reverse improves the IBC transient response to an output load dump.

### Thermal Considerations

The temperature distribution of the VI Brick can vary significantly with its input/output operating conditions, thermal management and environmental conditions. Although the PCB is UL rated to 130°C, it is recommended that PCB temperatures be maintained at or below 125°C.

For maximum long term reliability, lower PCB temperatures are recommended for continuous operation, however, short periods of operation at 125°C will not negatively impact performance or reliability.

WARNING: Thermal and voltage hazards. The IBC can operate with surface temperatures and operating voltages that may be hazardous to personnel. Ensure that adequate protection is in place to avoid inadvertent contact.

### Input Impedance Recommendations

To take full advantage of the IBC capabilities, the impedance presented to its input terminals must be low from DC to approximately 5 MHz.

The source should exhibit low inductance and should have a critically damped response. If the interconnect inductance is excessive, the IBC input pins should be bypassed with an RC damper (e.g., 47  $\mu$ F in series with 0.3  $\Omega$ ) to retain low source impedance and proper operation. Given the wide bandwidth of the IBC, the source response is generally the limiting factor in the overall system response.

Anomalies in the response of the source will appear at the output of the IBC multiplied by its K factor. The DC resistance of the source should be kept as low as possible to minimize voltage deviations. This is especially important if the IBC is operated near low or high line as the overvoltage/undervoltage detection circuitry could be activated.

### Input Fuse Recommendations

The IBC is not internally fused in order to provide flexibility in configuring power systems. However, input line fusing of VI Bricks must always be incorporated within the power system. A fast acting fuse should be placed in series with the +In port. See safety agency approvals.

### Application Notes

For IBC and VI Brick application notes on soldering, thermal management, board layout, and system design visit [vicorpower.com](http://vicorpower.com).

## PART NUMBERING

Product Family	Input Voltage	Package	Nominal Output Voltage	Temperature Grade	Output Current	Enable Logic	Pin Length	Options

\*For baseplate option please contact the factory for availability.

IBC BLOCK DIAGRAM

The Sine Amplitude Converter™ (SAC™) uses a high frequency resonant tank to transfer energy from input to output. The resonant tank is formed by  $C_r$  and leakage inductance from the main transformer,  $L_r$ , as shown in the block diagram. The controller regulates switching frequency of the FET drivers, monitors current sensing, and provides undervoltage and overvoltage protection.

**Vicor's comprehensive line of power solutions includes high density AC-DC and DC-DC modules and accessory components, fully configurable AC-DC and DC-DC power supplies, and complete custom power systems.**

Information furnished by Vicor is believed to be accurate and reliable. However, no responsibility is assumed by Vicor for its use. Vicor makes no representations or warranties with respect to the accuracy or completeness of the contents of this publication. Vicor reserves the right to make changes to any products, specifications, and product descriptions at any time without notice. Information published by Vicor has been checked and is believed to be accurate at the time it was printed; however, Vicor assumes no responsibility for inaccuracies. Testing and other quality controls are used to the extent Vicor deems necessary to support Vicor's product warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

**Specifications are subject to change without notice.**

## **Vicor's Standard Terms and Conditions**

All sales are subject to Vicor's Standard Terms and Conditions of Sale, which are available on Vicor's webpage or upon request.

## **Product Warranty**

In Vicor's standard terms and conditions of sale, Vicor warrants that its products are free from non-conformity to its Standard Specifications (the "Express Limited Warranty"). This warranty is extended only to the original Buyer for the period expiring two (2) years after the date of shipment and is not transferable.

UNLESS OTHERWISE EXPRESSLY STATED IN A WRITTEN SALES AGREEMENT SIGNED BY A DULY AUTHORIZED VICOR SIGNATORY, VICOR DISCLAIMS ALL REPRESENTATIONS, LIABILITIES, AND WARRANTIES OF ANY KIND (WHETHER ARISING BY IMPLICATION OR BY OPERATION OF LAW) WITH RESPECT TO THE PRODUCTS, INCLUDING, WITHOUT LIMITATION, ANY WARRANTIES OR REPRESENTATIONS AS TO MERCHANTABILITY, FITNESS FOR PARTICULAR PURPOSE, INFRINGEMENT OF ANY PATENT, COPYRIGHT, OR OTHER INTELLECTUAL PROPERTY RIGHT, OR ANY OTHER MATTER.

This warranty does not extend to products subjected to misuse, accident, or improper application, maintenance, or storage. Vicor shall not be liable for collateral or consequential damage. Vicor disclaims any and all liability arising out of the application or use of any product or circuit and assumes no liability for applications assistance or buyer product design. Buyers are responsible for their products and applications using Vicor products and components. Prior to using or distributing any products that include Vicor components, buyers should provide adequate design, testing and operating safeguards.

Vicor will repair or replace defective products in accordance with its own best judgment. For service under this warranty, the buyer must contact Vicor to obtain a Return Material Authorization (RMA) number and shipping instructions. Products returned without prior authorization will be returned to the buyer. The buyer will pay all charges incurred in returning the product to the factory. Vicor will pay all reshipment charges if the product was defective within the terms of this warranty.

## **Life Support Policy**

VICOR'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF VICOR CORPORATION. As used herein, life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness. Per Vicor Terms and Conditions of Sale, the user of Vicor products and components in life support applications assumes all risks of such use and indemnifies Vicor against all liability and damages.
