

### Features

- Input Voltage Range: 36 V to 75 V
- Programmable Output Voltage
- +90 % Efficiency
- 1500 VDC Isolation
- On/Off Control
- Over-Current Protection
- Differential Remote Sense
- Output Over-Voltage Protection
- Over-Temperature Shutdown
- Undervoltage Lockout
- Low Profile Package (12mm)
- Compact Footprint Comparable to ¼-Brick: (Horiz Config. 1.45 in × 2.6 in, Vertical Config. < 1 in<sup>2</sup>)
- Surface Mountable
- Agency Approvals: UL 60950, CSA 22.2 950
- IPC Lead Free 2

### Description

The PT4410 series of power modules are single-output isolated DC/DC converters, housed in a compact 21-pin low-profile (12 mm) package. These modules are rated up to 100W with load currents as high as 30 A. The output voltage is set within a pre-defined range via a 5-bit input code.

The PT4410 series operates from a standard 48-V telecom CO supply and occupies only 3.9 in<sup>2</sup> of PCB area. These modules offer OEMs a compact and flexible high-output power source for use with high-end microprocessors, DSPs, general purpose logic and analog. They are suitable for distributed power applications in both telecom and computing environments.

Features include output over-current protection, on/off control, output over-voltage protection (OVP), over-temperature shutdown, under-voltage lockout (UVLO), and an output differential remote sense. The modules are fully integrated for stand-alone operation, and require no additional components. The horizontal package outline is also comparable to industry standard ¼-bricks, allowing for a dual PWB layout.

### Ordering Information

PT4411□ = 1.3 to 3.5 Volts

PT4412□ = 1.05 to 1.75 Volts

PT4413□ = 3.4 to 5.7 Volts

### PT Series Suffix (PT1234x)

Case/Pin Configuration	Order Suffix	Package Code
Vertical	<b>N</b>	(ENM)
Horizontal	<b>A</b>	(ENN)
SMD	<b>C</b>	(ENP)

(Reference the applicable package code drawing for the dimensions and PC layout)

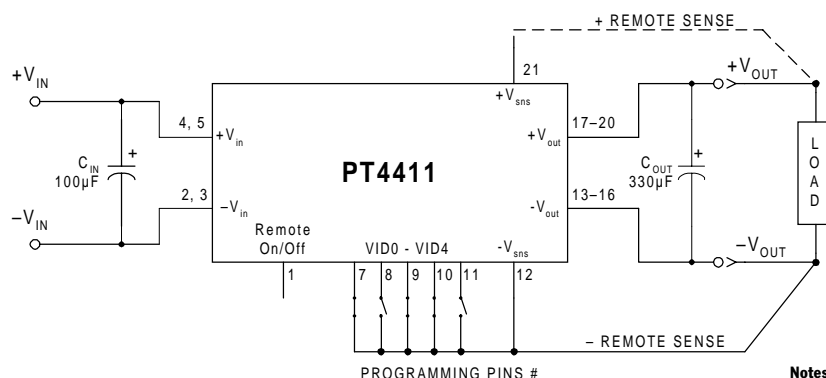

### Pin-Out Information

Pin	Function

Logic 0 =Pin 12 potential; (-)Remote Sense  
Logic 1 =Open circuit (no pull-up resistors)

\* N/D = Voltage is not defined. The regulator produces a low-voltage periodic pulse (less than 1 V) approximately every 10 ms.

**Note:** During operation, changes to the program code should be limited to 15 % of V<sub>o</sub> so as to avoid activating the output O V protection.

## Pin Descriptions

**+Vin:** The positive input for the module with respect to -V<sub>in</sub>. When powering the module from a -48-V telecom central office supply, this input is connected to the primary system ground.

**-Vin:** The negative input supply for the module, and the 0 VDC reference for the Remote On/Off input. When powering the module from a +48-V supply, this input is connected to the 48-V(Return).

**Remote On/Off:** An open-collector (open-drain) positive logic input that is referenced to -V<sub>in</sub>. Pulling this input down to -V<sub>in</sub> potential disables the module's output. If this input is left open-circuit, the module will produce an output whenever a valid input source is applied.

**VID0 – VID4:** Selects the set-point output voltage of the converter according to the applicable program code. VID0 – VID4 must either be connected to (-)Remote Sense or left open circuit. *Note:* For the PT4412, VID 4 is internally disabled and may be left open circuit.

**+Vo:** The positive power output with respect to -V<sub>o</sub>, which is DC isolated from the input supply pins. If a negative output voltage is desired, +V<sub>o</sub> should be connected to the secondary circuit common and the output taken from -V<sub>o</sub>.

**-Vo:** The negative power output with respect to +V<sub>o</sub>, which is DC isolated from the input supply pins. This output is normally connected to the secondary circuit common when a positive output voltage is desired.

**+Remote Sense:** Provides the converter with remote sense capability to regulate the set-point voltage directly at the load. When used with -Remote Sense, the regulation circuitry will compensate for voltage drop between the converter and the load. The pin may be left open circuit, but connecting it to +V<sub>o</sub> will improve load regulation.

**-Remote Sense:** This is the logic '0' reference for the inputs VID0 – VID4, and provides the converter with remote sense capability when used in conjunction with +Remote Sense. For optimum output voltage accuracy this pin should always be connected to -V<sub>o</sub>.

**PT4411 Specifications** (Unless otherwise stated,  $T_a = 25^\circ\text{C}$ ,  $V_{in} = 48\text{ V}$ ,  $V_o = 3.3\text{ V}$ ,  $C_o = 0\text{ }\mu\text{F}$ , and  $I_o = I_{o\text{max}}$ )

## Operating Features and System Considerations for the PT4400/PT4410 Series of DC/DC Converters

### Over-Current Protection

To protect against load faults these converters incorporate output over-current protection. Applying a load to the output that exceeds the converter's over-current threshold (see applicable specification) will cause the output voltage to momentarily fold back, and then shut down. Following shutdown the module will periodically attempt to automatically recover by initiating a soft-start power-up. This is often described as a "hiccup" mode of operation, whereby the module continues in the cycle of successive shutdown and power up until the load fault is removed. Once the fault is removed, the converter automatically recovers and returns to normal operation.

### Output Over-Voltage Protection

Each converter incorporates protection circuitry that continually senses for an output overvoltage (OV) condition. The O V threshold automatically tracks the VID output voltage program setting to a level that is 25 % higher than that programmed at the control pins, VID0 through VID4. If the converter output voltage exceeds this threshold, the converter is immediately shut down and remains in a latched-off state. To resume normal operation the converter must be actively reset. This can only be done by momentarily removing the input power to the converter. For failsafe operation and redundancy, the O V protection uses circuitry that is independent of the converter's internal feedback loop.

### Over-Temperature Protection

Over-temperature protection is provided by an internal temperature sensor, which closely monitors the temperature of the converter's metal case. If the case temperature exceeds a nominal 115 °C, the converter will shut down. The converter will then automatically restart when the sensed temperature drops back to approximately 105 °C. When operated outside its recommended thermal derating envelope (see data sheet SOA curves), the converter will typically cycle on and off at intervals from a few seconds to one or two minutes. This is to ensure that the internal components are not permanently damaged from excessive thermal stress.

### Under-Voltage Lockout

The Under-Voltage Lock-Out (UVLO) is designed to prevent the operation of the converter until the input voltage is close to the minimum input voltage. The converter is held off when the input voltage is below the UVLO threshold, and turns on when the input voltage rises above the threshold. This prevents high start-up current during normal power-up of the converter, and

minimizes the current drain from the input source during low input voltage conditions. The converter will meet full specifications when the minimum specified input voltage is reached. The UVLO circuitry also overrides the operation of the *Remote On/Off* control. Only when the input voltage is above the UVLO threshold will the *Remote On/Off* control be functional.

### Primary-Secondary Isolation

These converters incorporate electrical isolation between the input terminals (primary) and the output terminals (secondary). All converters are production tested to a withstand voltage of 1500VDC. This specification complies with UL60950 and EN60950 and the requirements for operational isolation. This allows the converter to be configured for either a positive or negative input voltage source. The data sheet 'Pin Descriptions' section provides guidance as to the correct reference that must be used for the external control signals.

### Input Current Limiting

**The converter is not internally fused.** For safety and overall system protection, the maximum input current to the converter must be limited. Active or passive current limiting can be used. Passive current limiting can be a fast acting fuse. A 125-V fuse, rated no more than 10 A, is recommended. Active current limiting can be implemented with a current limited "Hot-Swap" controller.

### Thermal Considerations

Airflow may be necessary to ensure that the module can supply the desired load current in environments with elevated ambient temperatures. The required airflow rate may be determined from the Safe Operating Area (SOA) thermal derating chart (see converter specifications). The recommended direction for airflow is into, or perpendicular to, the longest side of the module's metal case. See Figure 1.

Figure 1

Recommended direction for airflow is into (perpendicular to) the longest side.

### Using the Remote On/Off Function on the PT4400/PT4410 Series of DC/DC Converters

For applications requiring output voltage On/Off control, these converters incorporate a “Remote On/Off” control (pin 1). This feature can be used to switch the module off without removing the applied input source voltage.

The converter functions normally with Pin 1 open-circuit, providing a regulated output voltage when a valid source voltage is applied to +V<sub>in</sub> (pins 4, 5), with respect to -V<sub>in</sub> (pins 2, 3). When a low-level <sup>1</sup> ground signal is applied to pin 1, the converter output will be turned off.

Figure 1 is an application schematic, which shows the typical use of the *Remote On/Off* function. Note the discrete transistor (Q<sub>1</sub>). The Remote On/Off pin has its own internal pull-up, allowing it to be controlled with an open-collector or open-drain device (See notes 2 & 3). Table 1 gives the threshold requirements.

When placed in the “Off” state, the standby current drawn from the input source is typically reduced to less than 1mA.

**Table 1; Pin 1 Remote On/Off Control Requirements <sup>1</sup>**

Parameter	Min	Typ	Max
Enable (V <sub>IH</sub> )	4.5 V	—	—
Disable (V <sub>IL</sub> )	—	—	0.8 V
V <sub>OC</sub> [Open-Circuit]	—	5.0 V	—
I <sub>in</sub> [pin 1 at -V <sub>in</sub> ]	—	—	-0.5 mA

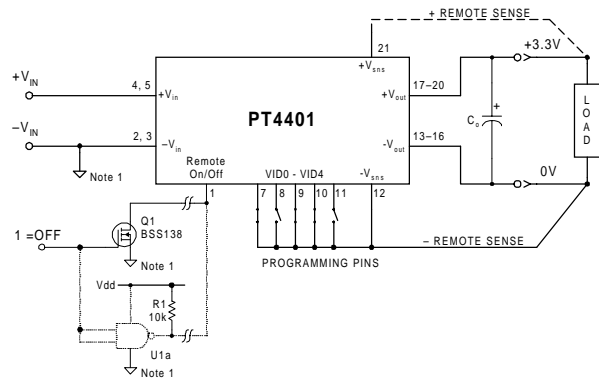

#### Notes:

1. The *Remote On/Off* control uses -V<sub>in</sub> (pins 2, 3) as its ground reference. All voltages are with respect to -V<sub>in</sub>.
2. Use an open-collector device (preferably a discrete transistor) for the *Remote On/Off* input. A pull-up resistor is not necessary. To disable the output voltage, the control pin should be pulled low to less than +0.8 V.
3. The *Remote On/Off* pin may be controlled with devices that have a totem-pole output. This is provided the output high-level voltage (V<sub>OH</sub>) meets the module's minimum V<sub>IH</sub> specified in Table 1. Do not apply more than +20 V. If a TTL gate is used, a pull-up resistor may be required to the logic supply voltage.
4. The converter incorporates an “Under-Voltage Lockout” (UVLO). The UVLO keeps the converter off until the input voltage is close to the minimum specified operating voltage. This is regardless of the state of the *Remote On/Off* control. Table 2 gives the UVLO input voltage thresholds.

**Table 2; UVLO Thresholds <sup>4</sup>**

Series	V <sub>in</sub> Range	UVLO Threshold
PT4400/4410	36 – 75 V	32V ±2 V

**Figure 1**

**Turn-On Time:** In the circuit of Figure 1, turning Q<sub>1</sub> on applies a low-voltage to pin 1 and disables the converter output. Correspondingly, turning Q<sub>1</sub> off allows pin 1 to be pulled high by an internal pull-up resistor. The converter produces a regulated output voltage within 50ms. Figure 2 shows the output response of a PT4401 following the turn-off of Q<sub>1</sub>. The turn off of Q<sub>1</sub> corresponds to the drop in Q<sub>1</sub> V<sub>gs</sub>. Although the rise-time of the output voltage is short (<5 ms), the indicated delay time will vary depending upon the input voltage and the module's internal timing. The output voltage of the PT4401 was set to 3.3 V by connecting VID0 (pin 7), VID2 (pin 9), and VID3 (pin 10) to the (-)Remote Sense (pin 12). The waveforms were measured with 48 VDC input voltage, and a 10 A resistive load.

**Figure 2**

## Pin-Coded Output Voltage Adjustment on the PT4400/4410 Series of DC/DC Converters

These DC/DC converters have a programmable output voltage. In each case the desired output voltage must be selected from one of a number of discrete voltages using the voltage programming control pins. Depending on each model's resolution and adjustment range, there are up to five control pins. They are identified *VID0-VID4* (pins 7-11) respectively. By selectively strapping these control pins to (-)Remote Sense (pin 12), the output voltage can be programmed to one of up to 32 different values over the defined output voltage range. The program code and output voltage range of the PT4401/4411 is also compatible with the "Voltage ID" code defined in the Intel® VRM 8.2 specification. Refer to the applicable product specification sheet for the program code.

### Notes:

- The programming convention is as follows:-  
Logic 0: Connect to pin 12 (-Remote Sense).  
Logic 1: Open circuit/open drain (See notes 2, & 4)
- Do not connect pull-up resistors to the voltage programming pins.
- To minimize output voltage error, always use pin 12 (-Remote Sense) as the logic "0" reference. While -V<sub>out</sub> (pins 13-16) can also be used for programming, doing so will degrade the voltage selection accuracy and load regulation of the product.
- When VID0-VID4 are all open circuit (logic 1), the output voltage is undefined. In this state the output voltage of the converter cannot be guaranteed, and can vary with output load and input voltage.
- On all models other than the PT4401/4411, the control

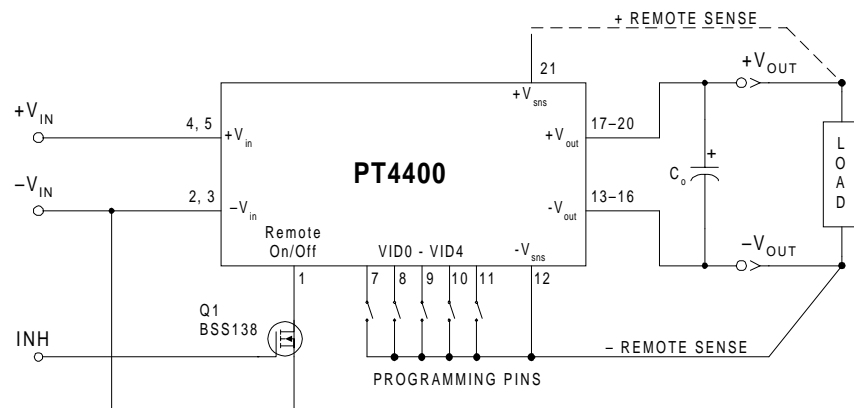

input VID4 (pin 11) is internally disabled and is not functional.

- If active devices are used to ground the voltage control pins, low-level open drain MOSFET devices should be used over bipolar transistors. The inherent  $V_{ce(sat)}$  in bipolar devices introduces errors in the device's internal voltage control circuit. Discrete transistors such as the BSS138 or IRLML2402 are examples of appropriate devices.

### Active Voltage Programming:

Special precautions should be taken when making changes to the voltage program code while the output is active. This activity induces a transient, which may activate the module's output over-voltage (OV) protection. Once triggered the OV protection circuit latches the output off, and requires the momentary removal of input power to reset the module. OV protection trips can be avoided by limiting the output voltage adjustment to no more than a 15 % change from the initial voltage. Large transitions are best made with a series of incremental changes, allowing 100  $\mu$ s settling time between each program state. When using active devices to program the output voltage, their state should be asserted prior to input power being applied. An alternative is to pull pin 1 (*Remote On/Off*) to -V<sub>in</sub> (pins 2, 3) during the application of power, assert the required program code, and then release pin 1. The module will then initiate a soft-start power-up to the desired program voltage.

## PCB Dual Layout for PT4400/4410 and ¼-Brick Package Alternate Build Option

The PCB footprint for the horizontal package versions (suffixes A & C) of the PT4400 and PT4410 series are dimensionally similar to a standard quarter-brick outline, making it easy to accommodate either package on the host PCB. This can provide the option for a second source, or in the case of the PT4400/4410 product, the added functionality of VID output voltage selection in a surface mount compatible package.

Figure 4-1 shows an example of an alternate PCB layout that will accommodate the surface mount version of the PT product (package code ENP). It should be noted that Figure 4-1 is a dimensionless drawing and is offered only as a guide. Please refer to the respective package outline drawing and PCB layout recommendations for the products actually employed. As an additional reference, Table 4-1 provides the pin-out for the PT4400/4410 series product.

**Table 4-1; PT4400/4410 Pin-Out Reference**

### PT4400/4410

Pin	Function
1	Remote On/Off
2	-V <sub>in</sub>
3	-V <sub>in</sub>
4	+V <sub>in</sub>
5	+V <sub>in</sub>
6	Pin Not Present
7	VID 0
8	VID 1
9	VID 2
10	VID 3
11	VID 4
12	Sense (-)
13	-V <sub>out</sub>
14	-V <sub>out</sub>
15	-V <sub>out</sub>
16	-V <sub>out</sub>
17	+V <sub>out</sub>
18	+V <sub>out</sub>
19	+V <sub>out</sub>
20	+V <sub>out</sub>
21	Sense (+)

PT4412C	LIFEBUY	SIP MODULE	ENP	21	8	TBD	Call TI	Level-3-215C-168HRS	
PT4413C	OBSOLETE	SIP MODULE	ENP	21		TBD	Call TI	Call TI	

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
