

SCAN921260 X6 1:10 Deserializer with IEEE 1149.1 (JTAG) and at-speed BIST

Check for Samples: [SCAN921260](#)

FEATURES

- IEEE 1149.1 (JTAG) Compliant and At-Speed BIST Test Modes
- Deserializes One to Six BusLVDS Input Serial Data Streams With Embedded Clocks
- Seven Selectable Serial Inputs to Support N+1 Redundancy of Deserialized Streams
- Seventh Channel Has Single Pin Monitor Output That Reflects Input From Seventh Channel Input
- Parallel Clock Rate Up To 66 MHz
- On Chip Filtering for PLL
- High Impedance Inputs Upon Power Off ($V_{CC} = 0V$)
- Single Power Supply at +3.3V
- 196-Pin NFBGA Package (Low-Profile Ball Grid Array) Package
- Industrial Temperature Range Operation: -40 to +85

DESCRIPTION

The SCAN921260 integrates six deserializer devices into a single chip. The SCAN921260 can simultaneously deserialize up to six data streams that have been serialized by the Texas Instruments SCAN921023 Bus LVDS serializer. The device also includes a seventh serial input channel that serves as a redundant input.

Each deserializer block in the SCAN921260 operates independently with its own clock recovery circuitry and lock-detect signaling.

The SCAN921260 uses a single +3.3V power supply with an estimated power dissipation of 1.2W at 3.3V with a PRBS-15 pattern. Refer to the Connection Diagrams for packaging information.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾⁽²⁾

Over operating free-air temperature range (unless otherwise noted)

Supply Voltage (V_{CC})		-0.3V to +4V
LVCMOS/LVTTL Input Voltage		-0.3V to 3.9V
LVCMOS/LVTTL Output Voltage		-0.3V to 3.9V
Bus LVDS Receiver Input Voltage		-0.3V to 3.9V
Bus LVDS Driver Output Voltage		-0.3V to 3.9V
Bus LVDS Output Short Circuit Duration		10ms
Junction Temperature		+150°C
Storage Temperature		-65°C to +150°C
Lead Temperature (Soldering, 10 seconds)		+225°C
Max Pkg Power Dissipation Capacity @ 25°C	196 NFBGA	3.7 W
Package Derating:	196 NFBGA	29.4 mW/°C above +25°C
Thermal Resistance:	θ_{JA}	34°C/W
	θ_{JC}	8°C/W
ESD Rating:	Human Body Model	>2KV
	Machine Model	>750V

- (1) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications
- (2) Absolute Maximum Ratings are those values beyond which the safety of the device cannot be ensured. They are not meant to imply that the devices should be operated at these limits. The table of [Electrical Characteristics](#) specifies conditions of device operation.

RECOMMENDED OPERATING CONDITIONS

	Min	Nom	Max	Units
Supply Voltage (V_{CC})	3.0	3.3	3.6	V
Operating Free Air Temperature (T_A)	-40	+25	+85	°C
Clock Rate	20		66	MHz

ELECTRICAL CHARACTERISTICS⁽¹⁾

Over recommended operating supply and temperature ranges unless otherwise specified

Symbol	Parameter	Conditions	Min	Typ	Max	Units

Timing Requirements for REFCLK						
t_{RCP}	REFCLK Period		15.15		50	ns
t_{RDC}	REFCLK Duty Cycle		40	50	60	%
$t_{RCP}/t_{TC P}$	Ratio of REFCLK to TCLK		0.95		1.05	
t_{RFTT}	REFCLK Transition Time				8	ns
Deserializer Switching Characteristics						
t_{RCP}	RCLK Period	RCLK	15.15		50	ns
t_{RDC}	RCLK Duty Cycle	RCLK ⁽²⁾	45	50	55	%
t_{CHTST}	Period of Bus LVDS signal when CHTST is selected by MUX	CHTST ⁽³⁾	25			ns
t_{CLH}	CMOS/TTL Low-to-High Transition Time	$C_L = 15$ pF		1.7	6	ns
t_{CHL}	CMOS/TTL High-to-Low Transition Time	$C_L = 15$ pF		1.6	6	ns
t_{ROS}	Rout Data Valid before RCLK	$C_L = 15$ pF, see Figure 3	$0.35 \cdot t_{RCP}$			ns
t_{ROH}	Rout Data Valid after RCLK	$C_L = 15$ pF, see Figure 3	$-0.35 \cdot t_{RCP}$			ns
t_{HZR}	High to Tri-state Delay	$C_L = 15$ pF, see Figure 8			12	ns
t_{LZR}	Low to Tri-state Delay				12	ns
t_{ZHR}	Tri-state to High Delay				12	ns
t_{ZLR}	Tri-state to Low Delay				12	ns
t_{DD}	Deserializer Delay	See Figure 2	$1.75 \cdot t_{RCP} + 3$	$1.75 \cdot t_{RCP} + 7$	$1.75 \cdot t_{RCP} + 10.5$	ns

(1) Typical values are given for $V_{CC} = 3.3$ V and $T_A = 25^\circ\text{C}$

(2) Specified by design using statistical analysis.

(3) Because the Bus LVDS serial data stream is not decoded, the maximum frequency of the CHTST output driver could be exceeded if the data stream were switched to CHTST. The maximum frequency of the BUS LVDS input should not exceed the parallel clock rate.

ELECTRICAL CHARACTERISTICS⁽¹⁾ (continued)

Over recommended operating supply and temperature ranges unless otherwise specified

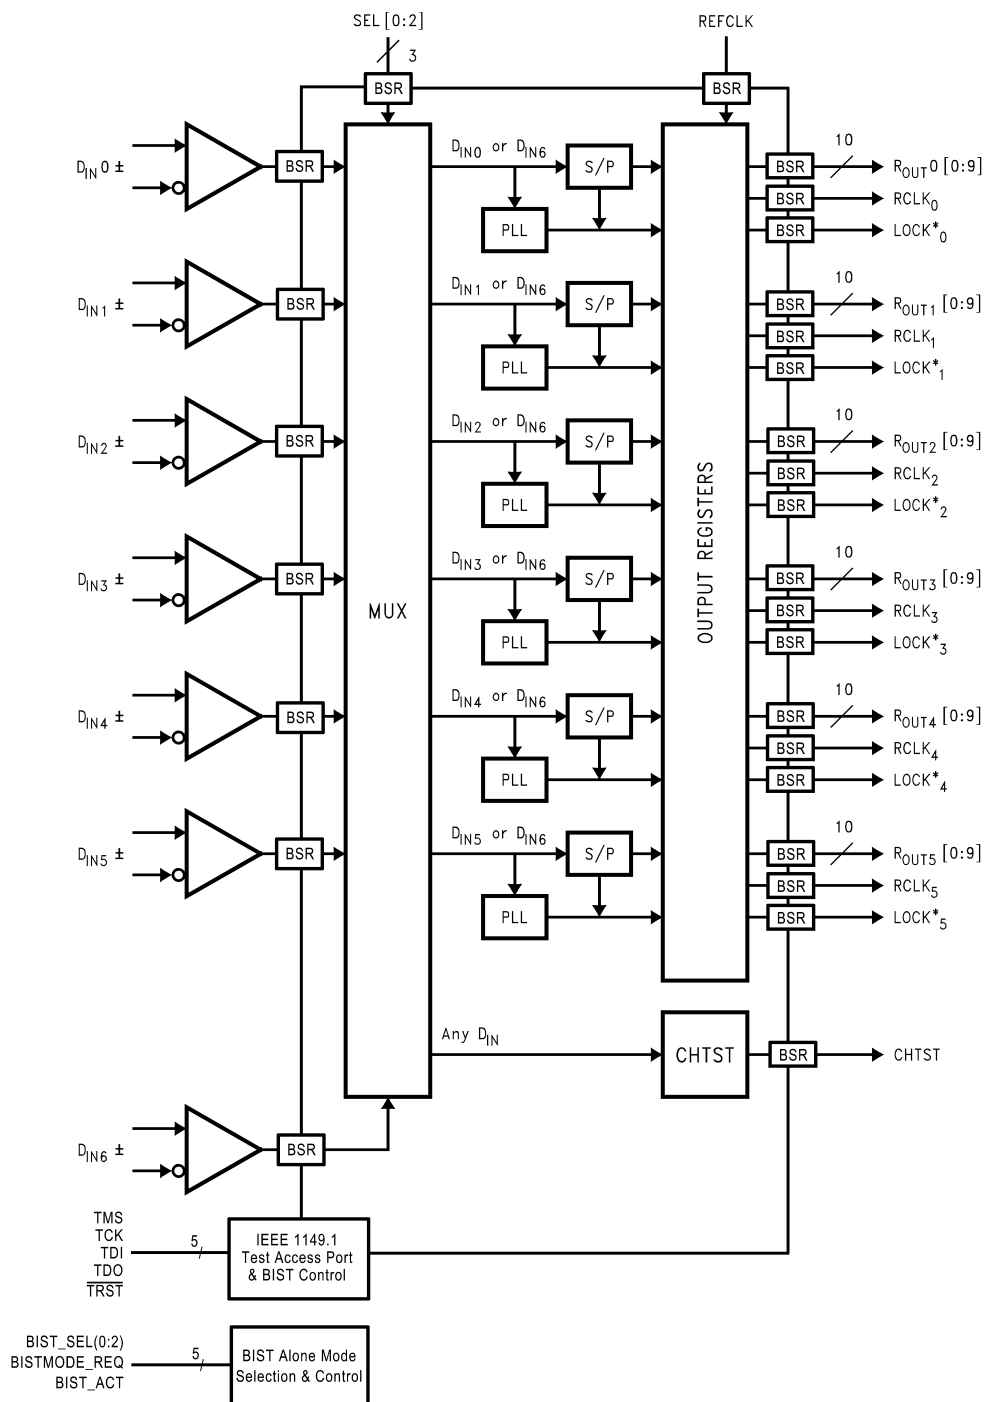

Symbol	Parameter	Conditions	Min	Typ	Max	Units
t_{DSR1}	Deserializer PLL LOCK Time from PWRDN (with SYNCPAT)	See Figure 4 ⁽⁴⁾	66 MHz		2	us
			20 MHz		10	us
t_{DSR2}	Deserializer PLL Lock Time from SYNCPAT	See Figure 5 ⁽⁴⁾	66 MHz		1.5	us
			20 MHz		5	us
t_{RNMI-R}	Ideal Strobe Window Right	66 MHz, see Figure 11			+400	ps
t_{RNMI-L}	Ideal Strobe Window Left	66 MHz, see Figure 11	-400			ps

- (4) For the purpose of specifying deserializer PLL performance t_{DSR1} and t_{DSR2} are specified with the REFCLK running and stable, and specific conditions of the incoming data stream (SYNCPATs). t_{DSR1} is the time required for the deserializer to indicate lock upon power-up or when leaving the power-down mode. t_{DSR2} is the time required to indicate lock for the powered-up and enabled deserializer when the input (RI+ and RI-) conditions change from not receiving data to receiving synchronization patterns (SYNCPATs). The time to lock to random data is dependent upon the incoming data.

SCAN CIRCUITRY TIMING REQUIREMENTS

APPLICATION INFORMATION

USING THE SCAN921023 and SCAN921260

The SCAN921260 combines six 1:10 deserializers into a single chip. Each of the six deserializers accepts a BusLVDS data stream up to 660 Mbps from TI's SCAN921023 Serializer. The deserializers then recover the embedded two clock bits and data to deliver the resulting 10-bit wide words to the output. A seventh serial data input provides n+1 redundancy capability. The user can program the seventh input to be an alternative input to any of the six deserializers. Whichever input is replaced by the seventh input is then routed to the CHANNEL TEST (CHTST) pin on receiver output port. The Deserializer uses a separate reference clock (REFCLK) and an onboard PLL to extract the clock information from the incoming data stream and then deserialize the data. The Deserializer monitors the incoming clock information, determines lock status, and asserts the LOCKn output high when loss of lock occurs.

Each of the 6 channels acts completely independent of each other. Each independent channel has outputs for a 10-bit wide data word, the recovered clock out, and the lock-detect output.

The SCAN921260 has three operating states: Initialization, Data Transfer, and Resynchronization. In addition, there are two passive states: Powerdown and Tri-state.

The following sections describe each operating mode and passive state.

INITIALIZATION

Before the SCAN921260 receives and deserializes data, it and the transmitting serializer devices must initialize the link. Initialization refers to synchronizing the Serializer's and the Deserializer's PLL's to local clocks. The local clocks must be the same frequency or within a specified range if from different sources. After all devices synchronize to local clocks, the Deserializers synchronize to the Serializers as the second and final initialization step.

Step 1: After applying power to the Deserializer, the outputs are held in Tri-state and the on-chip power-sequencing circuitry disables the internal circuits. When V_{cc} reaches V_{ccOK} (2.1V), the PLL in each deserializer begins locking to the local clock (REFCLK). A local on-board oscillator or other source provides the specified clock input to the REFCLK pin.

Step 2: The Deserializer PLL must synchronize to the Serializer to complete the initialization. Refer to the Serializer data sheet for the proper operation during this step of the Initialization State. The Deserializer identifies the rising clock edge in a synchronization pattern or random data and after 80 clock cycles will synchronize to the data stream from the serializer. At the point where the Deserializer's PLL locks to the embedded clock, the LOCKn pin goes low and valid data appears on the output. Note that this differs from previous deserializers where the LOCKn signal was not synchronous to valid data appearing on the outputs.

DATA TRANSFER

After initialization, the serializer transfers data to the deserializers. The serial data stream includes a start and stop bit appended by the serializer, which frame the ten data bits. The start bit is always high and the stop bit is always low. The start and stop bits also function as clock bits embedded in the serial stream.

The Serializer transmits the data and clock bits (10+2 bits) at 12 times the TCLK frequency. For example, if TCLK is 40 MHz, the serial rate is $40 \times 12 = 480$ Mbps. Since only 10 bits are from input data, the serial 'payload' rate is 10 times the TCLK frequency. For instance, if TCLK = 40 MHz, the payload data is $40 \times 10 = 400$ Mbps. TCLK is provided by the data source and must be in the range 20 MHz to 40 MHz nominal.

When one of six Deserializer channels synchronizes to the input from a Serializer, it drives its LOCKn pin low and synchronously delivers valid data on the output. The Deserializer locks to the embedded clock, uses it to generate multiple internal data strobes, and drives the embedded clock to the RCLKn pin. The RCLKn is synchronous to the data on the ROUT[n0:n9] pins. While LOCKn is low, data on ROUT [n0:n9] is valid. Otherwise, ROUT[n0:n9] is invalid.

All ROUT, LOCK, and RCLK signals will drive a minimum of three CMOS input gates (15pF load) with a 66 MHz clock. This amount of drive allows bussing outputs of two Deserializers and a destination ASIC. REN controls Tri-state of all the outputs.

The Deserializer input pins are high impedance during Powerdown (\overline{PWRDN} low) and power-off ($V_{cc} = 0V$).

RESYNCHRONIZATION

Whenever one of the six Deserializers loses lock, it will automatically try to resynchronize. For example, if the embedded clock edge is not detected two times in succession, the PLL loses lock and the LOCKn pin is driven high. The system must monitor the LOCKn pin to determine when data is valid.

The user has the choice of allowing the deserializer to re-synch to the data stream or to force synchronization by pulsing the Serializer SYNC1 or SYNC2 pin. This scheme is left up to the user discretion. One recommendation is to provide a feedback loop using the LOCKn pin itself to control the sync request of the Serializer (SYNC1 or SYNC2). Dual SYNC pins are given for multiple control in a multi-drop application.

POWERDOWN

The Powerdown state is a low power sleep mode that the Serializer and Deserializer typically occupy while waiting for initialization, or to reduce power consumption when no data is transferred. The Deserializer enters Powerdown when PWRDN is driven low. In Powerdown, the PLL stops and the outputs go into Tri-state, which reduces supply current to the microamp range. To exit Powerdown, the system drives PWRDN high.

Upon exiting Powerdown, the Deserializer enters the Initialization state. The system must then allow time to Initialize before data transfer can begin.

TRI-STATE

When the system drives REN pin low, the Deserializer enters Tri-state. This will tri-state the receiver output pins (ROUT[00:59]) and RCLK[0:5]. When the system drives REN high, the Deserializer will return to the previous state as long as all other control pins remain static (PWRDN).

IEEE 1149.1 TEST MODES

The SCAN921260 features interconnect test access that is compliant to the IEEE 1149.1 Standard for Boundary Scan Test (JTAG). All digital TTL I/O's on the device are accessible using IEEE 1149.1, and entering this test mode will override all input control cases including PWRDN and REN. In addition to the 4 required Test Access Port (TAP) signals of TMS, TCK, TDI, and TDO, TRST is provided for test reset.

To supplement the test coverage provided by the IEEE 1149.1 test access to the digital TTL pins, the SCAN921260 has two instructions to test the LVDS interconnects. The first is EXTEST. This is implemented at LVDS levels and is only intended as a go no-go test (e.g. missing cables). The second method is the RUNBIST instruction. It is an "at-system-speed" interconnect test. It is executed in approximately 33mS with a system clock speed of 66MHz. There are 12 bits in the RX BIST data register for notification of PASS/FAIL and TEST_COMPLETE; two bits for each of the six channels. The RX BIST register is defined as (from MSB to LSB):

[BIST COMPLETE for Channel 6, BIST PASS/FAIL for Channel 6, BIST COMPLETE for Channel 5, BIST PASS/FAIL for Channel 5, BIST COMPLETE for Channel 4, BIST PASS/FAIL for Channel 4, BIST COMPLETE for Channel 3, BIST PASS/FAIL for Channel 3, BIST COMPLETE for Channel 2, BIST PASS/FAIL for Channel 2, BIST COMPLETE for Channel 1, BIST PASS/FAIL for Channel 1]

A "pass" indicates that the BER (Bit-Error-Rate) is better than 10^{-7} . This is a minimum test, so a "fail" indication means that the BER is higher than 10^{-7} .

The BIST features of the SCAN921260 six (6) channel deserializer are compatible with the BIST features on the SCAN921023 Serializer.

An important detail is that once both devices have the RUNBIST instruction loaded into their respective instruction registers, both devices must move into the RTI state within 4K system clocks (At a system CLK of 66MHz and TCK of 1MHz this allows for 66 TCK cycles). This is not a concern when both devices are on the same scan chain or LSP, however, it can be a problem with some multi-drop devices. This test mode has been simulated and verified using TI's SCANSTA111.

Typical applications of 1149.1 are based around TTL-type inputs. With the introduction of 1149.1 into LVDS there have been many hurdles to overcome. One issue is that TTL inputs and outputs do not require bias circuits and are always on when power is applied. In the case of LVDS, there are many circuits required to make the inputs and outputs achieve their tight tolerances. These circuits require settle time once power is applied to ensure they function properly. These circuits are also the largest users of power within the device. To reduce power in standby, these devices have a PWRDN pin to shut these circuits down. There is also a REN pin that enables/disables the TTL outputs.

In the case of the 1149.1 functionality, these circuits need appropriate time to stabilize before they can be utilized. To achieve stability, these circuits are powered up when the TAP controller state machine is not in the *Test-Logic-Reset* state. The time that it takes a TAP to traverse from *Test-Logic-Reset* to *Capture-Data-Register* running at 25MHz is sufficient to allow these circuits to stabilize.

Once the TAP has left *Test-Logic-Reset*, the internal value of $\overline{\text{PWRDN}}$ is overridden and the device is powered up. This includes all fore mentioned circuits as well as all outputs. If an application requires that the outputs are to remain disabled during 1149.1 test, use REN and not $\overline{\text{PWRDN}}$.

KNOWN ERRATA: On the SCAN921260 only the overridden value of $\overline{\text{PWRDN}}$ ("1") is captured during all 1149.1 tests and not the external value as seen on the pin.

BIST ALONE TEST MODES

The SCAN921260 also supports a BIST Alone feature which can be run without enabling the JTAG TAP controller. This feature provides the ability to run continuos BER testing on all channels, or on individual channels without affecting live traffic on other channels. The ability to run the BERT while adjacent channels are carrying normal traffic is a useful tool to determine how normal traffic will affect BER on any given channel.

The BIST Alone features can be accessed using the 5 pins defined as BIST_SEL0, BIST_SEL1, BIST_SEL2, BIST_ACT, and BISTMODE_REQ.

BIST_ACT activates the BIST Alone mode. The BIST Alone mode will continue until deactivated by the BIST_ACT pin. The BIST_ACT input must be high or low for 4 or more clock cycles in order to activate or deactivate the BIST Alone mode. The BIST_ACT input is pulled low internally.

BISTMODE_REQ is used to select either gross error reporting or a specific output error report. When the BIST Alone mode is active, the LOCK(1:6) output for all channels running BIST Alone will go low, and ROUT(0:9) reports any error. When BISTMODE_REQ is low the error reporting is set to Gross Mode, and whenever a bit contains one or more errors, ROUT(0:9) for that channel goes high and stays high until deactivation by the BIST_ACT input. When BISTMODE_REQ is high, the output error reporting is set to Bit Error mode. Whenever any data bit contains an error, the data output for that corresponding bit goes high. The default is Gross Error mode.

The three BIST_SELn inputs determine which channel is in BIST Alone mode according to the following table:

Table 1. BIST Alone Mode Selection

BIST_ACT	BIST_SEL2	BIST_SEL1	BIST_SEL0	BIST for Channel
1	0	0	0	0
1	0	0	1	1
1	0	1	0	2
1	0	1	1	3
1	1	0	0	4
1	1	0	1	5
1	1	1	0	All Channels
1	1	1	1	IDLE
0	X	X	X	IDLE

POWER CONSIDERATIONS

An all CMOS design of the Deserializer makes it an inherently low power device.

POWERING UP THE DESERIALIZER

The SCAN921260 can be powered up at any time by following the proper sequence. The REFCLK input can be running before the Deserializer powers up, and it must be running in order for the Deserializer to lock to incoming data. The Deserializer outputs will remain in Tri-state until the Deserializer detects data transmission at its inputs and locks to the incoming data stream.

TRANSMITTING DATA

Once you power up the Deserializer, it must be phase locked to the transmitter to transmit data. Phase locking occurs when the Deserializer locks to incoming data or when the Serializer sends sync patterns. The Serializer sends SYNC patterns whenever the SYNC1 or SYNC2 inputs are high. The $\overline{\text{LOCK}}_n$ output of the Deserializer remains high until it has locked to the incoming data stream. Connecting the $\overline{\text{LOCK}}_n$ output of the Deserializer to one of the SYNC inputs of the Serializer will ensure that enough SYNC patterns are sent to achieve Deserializer lock.

The Deserializer can also lock to incoming data by simply powering up the device and allowing the “random lock” circuitry to find and lock to the data stream.

While the Deserializer $\overline{\text{LOCK}}_n$ output is low, data at the Deserializer outputs (ROUT0-9) are valid, except for the specific case of loss of lock during transmission which is further discussed in [RECOVERING FROM LOCK LOSS](#).

NOISE MARGIN

The Deserializer noise margin is the amount of input jitter (phase noise) that the Deserializer can tolerate and still reliably receive data. Various environmental and systematic factors include:

- Serializer: TCLK jitter, V_{CC} noise (noise bandwidth and out-of-band noise)
- Media: ISI, Large V_{CM} shifts
- Deserializer: V_{CC} noise

RECOVERING FROM LOCK LOSS

In the case where the Deserializer loses lock during data transmission, up to 1 cycle of data that was previously received can be invalid. This is due to the delay in the lock detection circuit. The lock detect circuit requires that invalid clock information be received 2 times in a row to indicate loss of lock. Since clock information has been lost, it is possible that data was also lost during these cycles. Therefore, after the Deserializer relocks to the incoming data stream and the Deserializer $\overline{\text{LOCK}}_n$ pin goes low, at least one previous data cycle should be suspect for bit errors.

The Deserializer can relock to the incoming data stream by making the Serializer resend SYNC patterns, as described above, or by random locking, which can take more time, depending on the data patterns being received.

HOT INSERTION

All the BusLVDS devices are hot pluggable if you follow a few rules. When inserting, ensure the Ground pin(s) makes contact first, then the VCC pin(s), and then the I/O pins. When removing, the I/O pins should be unplugged first, then the VCC, then the Ground. Random lock hot insertion is illustrated in [Figure 11](#).

PCB LAYOUT AND POWER SYSTEM CONSIDERATIONS

Circuit board layout and stack-up for the SCAN921260 should be designed to provide noise-free power to the device. Good layout practice will separate high frequency or high level inputs and outputs to minimize unwanted stray noise pickup, feedback and interference. There are a few common practices which should be followed when designing PCB's for Bus LVDS Signaling. Recommended layout practices are:

- Use at least 4 PCB board layers (Bus LVDS signals, ground, power, and TTL signals).
 - Power system performance may be greatly improved by using thin dielectrics (4 to 10 mils) for power/ground sandwiches. This increases the intrinsic capacitance of the PCB power system which improves power supply filtering, especially at high frequencies, and makes the value and placement of external bypass capacitors less critical.
- Keep Serializers and Deserializers as close to the (Bus LVDS port side) connector as possible.
 - Longer stubs lower the impedance of the bus, increase the load on the Serializer, and lower the threshold margin at the Deserializers. Deserializer devices should be placed much less than one inch from slot connectors. Because transition times are very fast on the Serializer Bus LVDS outputs, reducing stub lengths as much as possible is the best method to ensure signal integrity.
- Bypass each Bus LVDS device and also use distributed bulk capacitance between power planes.

- Surface mount capacitors placed close to power and ground pins work best. External bypass capacitors should include both RF ceramic and tantalum electrolytic types. RF capacitors may use values in the range 0.001 μF to 0.1 μF . Tantalum capacitors may be in the range 2.2 μF to 10 μF . Voltage rating for tantalum capacitors should be at least 5X the power supply voltage being used. Randomly distributed bypass capacitors should also be used.
- Package and pin layout permitting, it is also recommended to use two vias at each power pin as well as all RF bypass capacitor terminals. Dual vias reduce the interconnect inductance between layers by up to half, thereby reducing interconnect inductance and extending the effective frequency range of the bypass components.
- Leave unused Bus LVDS receiver inputs open (floating).
- Isolate TTL signals from Bus LVDS signals.

There are more common practices which should be followed when designing PCBs for BLVDS/LVDS signaling. General application guidelines are available in the LVDS Owner's Manual, which may be found at www.ti.com/ww/en/analog/interface/lvds.shtml. For packaging information on BGA's, please see AN-1126(SNOA021)

TRANSMISSION MEDIA

The Serializer and Deserializer can also be used in point-to-point configurations, through PCB trace, or through twisted pair cable. In point-to-point configurations, the transmission media need only be terminated at the receiver end. Please note that in point-to-point configurations, the potential of offsetting the ground levels of the Serializer vs. the Deserializer must be considered. Also, Bus LVDS provides a $\pm 1.2\text{V}$ common mode range at the receiver inputs.

FAILSAFE BIASING FOR THE SCAN921260

The SCAN921260 has internal failsafe biasing and an improved input threshold sensitivity of $\pm 50\text{mV}$ versus $\pm 100\text{mV}$ for the DS92LV1210 or DS92LV1212. This allows for greater differential noise margin in the SCAN921260. However, in cases where the receiver input is not being actively driven, the increased sensitivity of the SCAN921260 can pickup noise as a signal and cause unintentional locking. For example, this can occur when the input cable is disconnected.

External resistors can be added to the receiver circuit board to prevent noise pick-up. Typically, the non-inverting receiver input is pulled up and the inverting receiver input is pulled down by high value resistors. The pull-up and pull-down resistors (R_1 and R_2) provide a current path through the termination resistor (R_L) which biases the receiver inputs when they are not connected to an active driver. The value of the pull-up and pull-down resistors should be chosen so that enough current is drawn to provide a $+15\text{mV}$ drop across the termination resistor. Please see [Figure 9](#) for the Failsafe Biasing Setup.

The parameter t_{RNM} is calculated by first measuring how much of the ideal bit the receiver needs to ensure correct sampling. After determining this amount, what remains of the ideal bit that is available for external sources of noise is called t_{RNM} . It is the offset from $t_{\text{DJIT(min or max)}}$ for the test mask within the eye opening.

The vertical limits of the mask are determined by the SCAN921260 receiver input threshold of $\pm 50\text{mV}$.

Please refer to the eye mask pattern of [Figure 10](#) for a graphic representation of t_{DJIT} and t_{RNM} .

Figure 9. Failsafe Biasing Setup

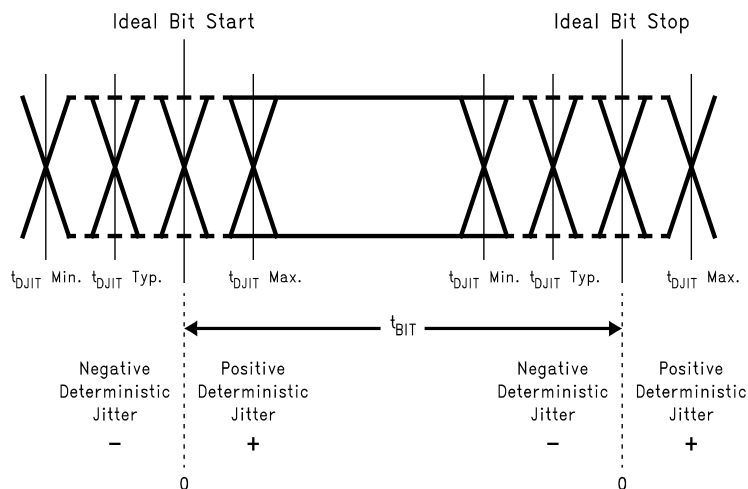

Figure 10. Deterministic Jitter and ideal Bit Position

$$\text{Ideal Sampling Position} = \frac{(t_{\text{BIT}})}{2}$$

$t_{\text{RNMI-L}}$ is the ideal noise margin on the left of the figure, it is a negative value to indicate early with respect to ideal.
 $t_{\text{RNMI-R}}$ is the ideal noise margin on the right of the above figure, it is a positive value to indicate late with respect to ideal.

Figure 11. Ideal Deserializer Noise Margin (t_{RNMI}) and Sampling Window

PIN DIAGRAM

Figure 12. SCAN921260UJB and SCAN921260UJBX (196 pin NFBGA)

Table 2. PIN DESCRIPTIONS

Pin Name	Type	Pins	Description
SEL (0:2)	CMOS Input	B13, C12, C13	These pins control which Bus LVDS input is steered to the CHTST output. The Control Pins Truth Table describes their function. There are weak internal pull-ups that should default all SEL(0:2) to high. For example, if you choose not to use Channel Test Mode and want the CHTST output permanently disabled, you can tie SEL2 and SEL1 high and SEL0 low. In a noisy operating environment, it is recommended that an external pull up be used to ensure that SELn is in the high state.
Rin +/- n	Bus LVDS Input	A4-A3, A7-A6, A10-A9, A13-A12, C6-C5, C9-C8, C11-C10,	Bus LVDS differential input pins
AGND		A5, A8, B7, B8, B11	Analog Ground
AVDD		A11, B6, B9, C7	Analog Voltage Supply
PWRDN	CMOS Input	B5	A low on this pin puts the device into sleep mode and a high makes the part active. There is an internal pull-down that defaults PWRDN to sleep mode. Active operation requires asserting a high on PWRDN.

Table 2. PIN DESCRIPTIONS (continued)

Pin Name	Type	Pins	Description
REN	CMOS Input	A2	Enables the Routn and RCLKn outputs. There is an internal pull-down that defaults REN to tri-state the outputs. Active outputs require asserting a high on REN.
REFCLK	CMOS Input	B4	Frequency reference clock input.
CHTST	CMOS Output	C3	Allows low speed testing of the Rin inputs under control of the SEL (0:2) pins.
$\overline{\text{LOCK}}$ (0:5)	CMOS Output	F3, P1, N3, P12, P13, D13	Indicates the status of the PLLs for the individual deserializers: $\overline{\text{LOCK}} = \text{L}$ indicates locked, $\overline{\text{LOCK}} = \text{H}$ indicates unlocked.
Rout nx	CMOS Output	E2, E4, E12, E13, E14, F4, G3, G4, G11, G12, H2, H3, H4, H11, H12, J2, J3, J11, J12, K2, K3, K4, K12, K13, L1, L3, L6, L8, L9, L11, L12, L13, L14, M1, M2, M3, M4, M5, M6, M7, M8, M9, M10, M11, M12, M14, N1, N2, N4, N6, N9, N11, N12, N13, N14, P2, P3, P4, P11, P14	Outputs for the ten bit deserializers, n = deserializer number, x = bit number
RCLK (0:5)	CMOS Output	F2, F13, L2, M13, N5, N10	Recovered clock for each deserializer's output data.
DVDD		B1, B3, C4, D6, D12, E6, E7, E9, E10, F7, F10, F12, G6, G10, H6, H10, J5, J8, J9, J10, K5, K6, K7, K10, L10	Digital Supply Voltage.
DGND		A1, B2, B14, D4, D5, D7, D9, D11, E5, E8, F5, F6, F9, G5, G7, G8, G9, H5, H7, H8, H9, J6, J7, K8, K9, L7	Digital Ground.
PVDD		E1, F1, F14, G14, J1, J14, K1, K14, P5, P6, P9, P10	PLL Supply Voltage.
PGND		A14, B12, D10, F8, G1, G2, G13, H1, H13, H14, J4, J13, N7, N8, P7, P8	PLL Ground.
TMS	CMOS Input	C1	Test Mode Select input to support IEEE 1149.1
$\overline{\text{TRST}}$	CMOS Input	C2	Test Reset Input to support IEEE 1149.1
TDI	CMOS Input	D1	Test Data Input to support IEEE 1149.1
TCK	CMOS Input	D2	Test Clock to support IEEE 1149.1
TDO	CMOS Output	D3	Test Data Output to support TDO
BISTMODE_REQ	CMOS Input	B10	BIST Alone Error Reporting Mode Select Input
BIST_SEL(0:2)	CMOS Input	C14, D8, D14	These pins control which channels are active for the BIST Alone operation mode. The BIST Alone Mode Selection Table describes their function. There are internal pull-ups that default all BIST_SEL(0:2) to high, which is the idle state for all channels in BIST Alone mode.
CHTST_EN	CMOS Input	E3	A high on this input enables the CHTST output. There is an internal pull-up that defaults the CHTST output to the active mode. Note: CHTST_EN requires two clock cycles before CHTST is enabled or disabled. When not using CHTST output, assert a low on this control pin to reduce power consumption.

Table 2. PIN DESCRIPTIONS (continued)

Pin Name	Type	Pins	Description
BIST_ACT	CMOS Input	K11	A high on this pin activates the BIST Alone operating mode. There is a weak internal pull-down that should default the BIST_ACT to deactivate the BIST Alone operating mode. In a noisy operating environment, it is recommended that an external pull down be used to ensure that BIST_ACT is in the low state.
N/C		E11, F11, L4, L5	Unused solder ball location. Do not connect.

REVISION HISTORY

Changes from Revision E (April 2013) to Revision F	Page
• Changed layout of National Data Sheet to TI format	17

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
SCAN921260UJB/NOPB	ACTIVE	NFBGA	NZH	196	119	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-260C-168 HR	-40 to 85	SCAN921260 UJB	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

UJB196A (Rev C)

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
