## Using the TPS2410EVM

# **User's Guide**

Literature Number: SLVU181A October 2006-Revised February 2012

### TPS2410 EVM (HPA204)

This user's guide is to facilitate operation of the TPS2410 and TPS2411 evaluation module. It is used by an engineer or technician and supplements the TPS2410/11 data sheet, schematics, and circuit board labeling.

#### 1 Introduction

The TPS2410 controls an N-channel MOSFET to operate in circuit as an ideal diode. The MOSFET source and drain voltages are monitored by TPS2410 pins A and C. The TPS2410 drives the MOSFET gate high if VAC exceeds 10 mV, and turns the MOSFET off if VAC falls below a threshold that is both programmable and dependent on the choice of TPS2410 or TPS2411.

The TPS2410 has a turn-off point of 2.5-mv V<sub>AC</sub>.

TPS2411 is similar to TPS2410 when RSET is open and has a resistor programmable MOSFET turn-off point. The TPS2411 can even be set to a slightly negative shutdown allowing for some voltage back current.

Figure 1 shows the conventional wire-OR of power supplies with diodes. Each diode D1 and D2 is replaced by a TPS2410 and MOSFET eliminating the voltage and power loss in the diode.

The evaluation module is set up to wire-OR two power supplies for redundant power to a load using two TPS2410s and MOSFETs. This document contains setup and user information about this evaluation module to assist with the operation of TPS2410.

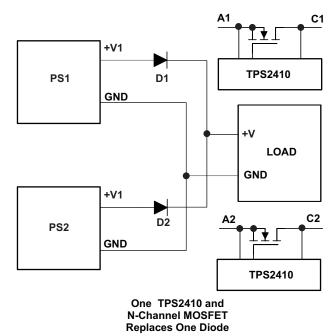

Figure 1. Conventional Wire-OR Power Supplies

2

Reference Figure 2, a block diagram of the TPS2410EVM and TPS2411EVM.

- The **5-V supply** is used to power status LEDs. It is jumper selected to power VDD on the TPS2410s and the glitch circuit if the control voltage is less than 3.0 V.
- The **status** outputs turn on LEDs to give a visual condition of the system Fault, power good and gate status are displayed.
- The **Glitch** maker, discussed in the Test Methods Section applies a 1-Ω load to the input supply for 100 µs. This disruption allows the user to scope test points and observe system recovery.
- The **RSET** resistor is used to program the turn-off point of the TPS2411.
- The Filter compensates for system noise.
- The UV and OV circuits set permissible limits for input operating voltage.

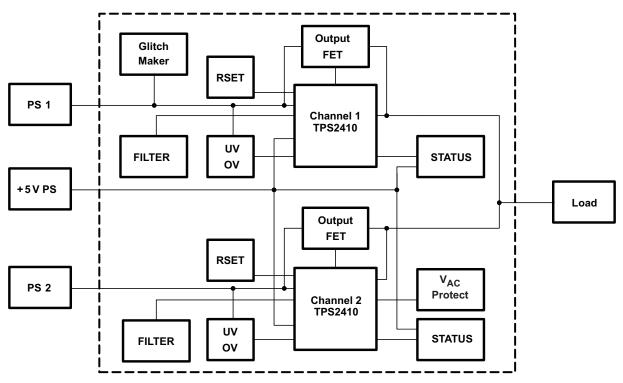

Figure 2. EVM Block Diagram

#### 2 MOSFET Configurations

The TPS2410 EVM is supplied with IRL3713 MOSFETS. These MOSFETs can be replaced with user selected parts if desired as there are alternative MOSFET footprints that accept N-channel parts in D2PACK, DPACK, and SOIC packages. The schematic is shown in Section 4.

The MOSFETs are configured to operate as singles with only Q6 and Q13 populated as supplied. They may be configured to operate in parallel on the PS1 channel by populating Q6 and Q5 and shorting drain to source on Q4. Similarly, for parallel operation on the PS2 channel, populate Q13 and Q12 and short drain to source on Q11. MOSFETs can be configured back-to-back by populating only Q4 and Q5 on channel 1, and Q12 and Q11 on channel 2.

In single or parallel configurations, the body diode of the MOSFET limits  $V_{AC}$  to 0.7 V. For back to back MOSFETs, there could be a danger of exceeding the  $V_{AC}$  operating maximum 5 V. The  $V_{AC}$  protect circuit is a low powered FET that is turned on when  $V_{AC}$  approaches the maximum.

#### 3 LED Indicators

Each channel has LED indicators for fault (FLTB), gate status (STAT), and power good (PG). Table 1 summarizes the indicators. Each is indicator is labeled on the circuit board for easy reference.

Indicator	Channel 1	Channel 2	LED On
Fault (FLTB)	D3	D8	Fault = on
Gate Status (STAT)	D2	D7	Bad gate = on
Power Good (PG)	D1	D6	Power good = on

#### **Table 1. LED Indicators**

#### 3.1 User Circuits

There are two sections of the circuit board with plated through holes for user defined circuits.

#### 3.2 Materials Needed – TI Supplied

- TPS2410 evaluation module
- TPS2410 reference design documentation
- TPS2410 data sheet

#### 3.3 User Supplied

- 2 power supplies for wire-OR to load, up to 25 A
- 1 5-V power supply to supply EVM
- Power supply cables
- · Load active load, power resistors or actual load
- Oscilloscope
- · Current probe
- Differential probe

4

#### 3.4 Jumper Description

#### Jumpers J1, J2, J13, J14

 $V_{DD}$  can be powered by the input power supply pin A, Jump J2-2, 3 and J14-2, 3. When it is powered by the load, pin C, jump J2-1, 2 and J14-1, 2. If A and C are less than 3 V, connect the 5 V to  $V_{DD}$ , jumper J1-1 to J2 -2 and J13-1 to J14-2.

#### J3, J15

Jumpers J3 and J15 connect a pot to the RSET pin when testing the TPS2411. These jumpers are normally left open when testing the TPS2410.

#### J4, J17

Jumpers J4 and J17 are open to enable the UV and OV inputs to the TPS2410.

#### J6

Jumper J6 is on to connect the STAT pins together on both TPS2410 channels. When the STAT pin is low, the turn off of the channel powering the load is de-sensitized.

#### J8

Jumper J8 is the gate voltage for the Glitch FET. Jump J8-2, 3 when the PS1 voltage is greater than 5 V. Jump J8-1, 2 to use the 5-V supply when PS1 is less than 5 V.

#### J16

Jumper J16-2, 3 connects pin C to the load for single or parallel FETs. Connect J16-1, 2 to protect the pin A and C inputs when output FETs are configured back-to-back.

#### 3.5 Procedure – Jumper Set-Up

An initial jumper setup is recommended in Table 2. The module has flexibility to operate in other modes. Change jumpers to operate in other configurations as required after getting started. After the initial setup, reference the schematic and set jumpers as required for testing. Other J reference designators on the schematic are simple connectors.

Jumper	Function	Selection	Comment
J1	5 V to V <sub>DD</sub> , CH1	Open	
J2	A or C to V <sub>DD</sub> , CH1	Jumper 2 - 3	Connects A
J3	Install to use RSET, CH1	Open	
J4	In to disable OV channel 1	Open	
J6	In to OR STAT lines	Open	
J8	5 V or PS1 to gate of PS1 pulse	Jumper 2 - 3	Connects PS1
J13	5 V to V <sub>DD</sub> , CH1	Open	
J14	A or C to Vdd, CH2	Jumper 2 - 3	Connects A
J15	Install to use RSET, CH2	Open	
J16	Connects the load to CH2 C or FET	Jumper 2 - 3	Connects C
J17	In to disable OV Channel 2	Open	

#### Table 2. Initial Jumper Settings

LED Indicators

LED Indicators

#### 3.6 Power Supply Connection

Connect the power supplies and load to the TPS2410 test card as shown in Table 3. Loading less than 30 A is safe for IRI3713S. The load can be a test load or the actual system load.

Supply	Terminal
+V	PS1, J12
PS1, J312	IN1, J5
GND	PS1GND, J10
+V	PS2, J18
GND	PS2GND, J19
5 V	J20-2
GND	J20-1
Load, +V	J7
GND	J11
_	+V PS1, J312 GND +V GND 5 V GND Load, +V

#### Table 3. Power Supply Connection

#### 3.7 OV and UV Setup

Set the OV and UV pots for each input voltage selected and re-adjust these pots when the input voltage range is changed.

For this example, PS1 and PS2 are 12 V  $\pm$ 20 %. Set PS1 to the under-voltage set point, 9.6 V, and adjust R13 until TP7 measures 0.6 V, reference Table 4. Set PS1 to the over-voltage set point, 14.4 V, and adjust R12 until TP10 measures 0.6 V.

Complete this procedure for channel 2. Set the power supply voltages, PS1 and PS2, to the typical input, 12 V.

Supply Setting	Potentiometer	Test Point
PS1-UV	R13	TP7
PS1-OV	R12	TP10
PS2-UV	R32	TP24
PS2-OV	R31	TP26

#### Table 4. UV and OV Setup

#### 3.8 Test Points

Table 5 lists some common test points for observation. There are more test points shown on the schematic.

#### **Table 5. Common Test Points**

Function	TP Channel 1	TP Channel 2
A	TP2	TP18
С	TP9	_
GATE	TP11	TP22
OV INPUT	TP10	TP26
UV INPUT	TP7	TP24
FAULT	TP8	TP25
PG	TP4	TP20

#### 3.9 RSET

RSET is usually used in TPS2411 and sometimes in the TPS2410 to program the MOSFET turn-off point. The RSET calculation from the data sheet is:

$$R_{RSET} = \left(\frac{-470.02}{V_{OFF} - 0.00314}\right)$$

(1)

LED Indicators

Calculate the RSET resistor. For the PS1 channel, remove jumper J3 and connect an ohm-meter from J3-2 to GND. Adjust pot R8 for the calculated resistance value. Install the jumper J3-1, 2. Repeat for the PS2 channel RSET Pot R26 and jumper J15. The component reference designators for each channel is summarized in Table 6.

Table 6. RESET Resistor Setting

RSET Pot	Jumper	Measure
R8	J3	J3-2
R26	J15	J15-2

#### 3.10 Test Methods

The EVM has many operating configurations to view the system response. The user can make modifications to the EVM jumpers and test other set ups.

#### 3.11 Adjust Input Power Supplies

Vary the input voltages to observe system behavior. Jumpers can be set as in Table 2. Turn the power supplies to the application typical volts; for this paper, we will use 12 V. The load is shared between the supplies. Both gates will be on and the power supply current meters show output. Decrease one supply voltage slightly and note the gate on that channel pass FET turn off and the other channel FET gate increases to keep the FET on to supply the load. Observe the FET gates with a scope. With a voltmeter, verify  $V_{DS}$  for the on channel to be tens of millivolts.

#### 3.12 Glitch Maker

Remove the jumper from J5 to J12 and connect the power supply to J12. This reduces the bulk capacitance at the PCB power supply input. Set power supplies up for equal or slight differential voltage so that the PS1 supply is contributing to the load. Press momentary switch S1, labeled PULSE. The switch closure places a 1- $\Omega$  load across the input power supply for 100 µs. Observe the effect of an input power supply glitch. Scope on the MOSFET gates, load voltage, TPS2410 fault output, STAT, PG.

#### 3.13 Load Change

A dynamic change to the load can be made by switching additional load on or off with an external switch. Some power load test equipment can be used to dynamically change the load.

#### **IMPORTANT NOTICE**

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
