

FOUR-CHANNEL AUTOMOTIVE DIGITAL AMPLIFIERS

Check for Samples: [TAS5414B-Q1](#), [TAS5424B-Q1](#)

FEATURES

- TAS5414B-Q1 – Single-Ended Input
- TAS5424B-Q1 – Differential Input
- Four-Channel Digital Power Amplifier
- Four Analog Inputs, Four BTL Power Outputs
- Typical Output Power at 10% THD+N
 - 28 W/Ch Into 4 Ω at 14.4 V
 - 50 W/Ch Into 2 Ω at 14.4 V
 - 79 W/Ch Into 4 Ω at 24 V
 - 150 W/Ch Into 2 Ω at 24 V (PBTL)
- Channels Can Be Paralleled (PBTL) for High Current Applications
- THD+N < 0.02%, 1 kHz, 1 W Into 4 Ω
- Patented Pop- and Click-Reduction Technology
 - Soft Muting With Gain Ramp Control
 - Common-Mode Ramping
- Patented AM Interference Avoidance
- Patented Cycle-by-Cycle Current Limit
- 75-dB PSRR
- Four-Address I²C Serial Interface for Device Configuration and Control
- Channel Gains: 12-dB, 20-dB, 26-dB, 32-dB
- Load Diagnostic Functions:
 - Output Open and Shorted Load
 - Output-to-Power and -to-Ground Shorts
 - Patented Tweeter Detection
- Protection and Monitoring Functions:
 - Short-Circuit Protection
 - Load-Dump Protection to 50 V
 - Fortuitous Open Ground and Power Tolerant
 - Patented Output DC Level Detection While Music Playing
 - Over-temperature Protection
 - Over- and Undervoltage Conditions
 - Clip Detection

- 36-Pin PSOP3 (DKD) Power SOP Package With Heat Slug Up for the TAS5414B-Q1
- 44-Pin PSOP3 (DKD) Power SOP Package With Heat Slug Up for the TAS5424B-Q1
- 44-Pin PSOP3 (DKE) Low-Standoff Power SOP Package With Heat Slug Up for the TAS5424B-Q1
- 64-Pin QFP (PHD) Power Package With Heat Slug Up for TAS5414B-Q1
- Designed for Automotive EMC Requirements
- Qualified According to AEC-Q100
- ISO9000:2002 TS16949 Certified
- –40°C to 105°C Ambient Temperature Range

APPLICATIONS

- OEM/Retail Head Units and Amplifier Modules Where Feature Densities and System Configurations Require Reduction in Heat From the Audio Power Amplifier

DESCRIPTION

The TAS5414B-Q1 and TAS5424B-Q1 are four-channel digital audio amplifiers designed for use in automotive head units and external amplifier modules. They provide four channels at 23 W continuously into 4 Ω at less than 1% THD+N from a 14.4-V supply. Each channel can also deliver 38 W into 2 Ω at 1% THD+N. The TAS5414B-Q1 uses single-ended analog inputs, while the TAS5424B-Q1 employs differential inputs for increased immunity to common-mode system noise. The digital PWM topology of the device provides dramatic improvements in efficiency over traditional linear amplifier solutions. This reduces the power dissipated by the amplifier by a factor of ten under typical music playback conditions. The device incorporates all the functionality needed to perform in the demanding OEM applications area. They have built-in load diagnostic functions for detecting and diagnosing misconnected outputs to help to reduce test time during the manufacturing process.

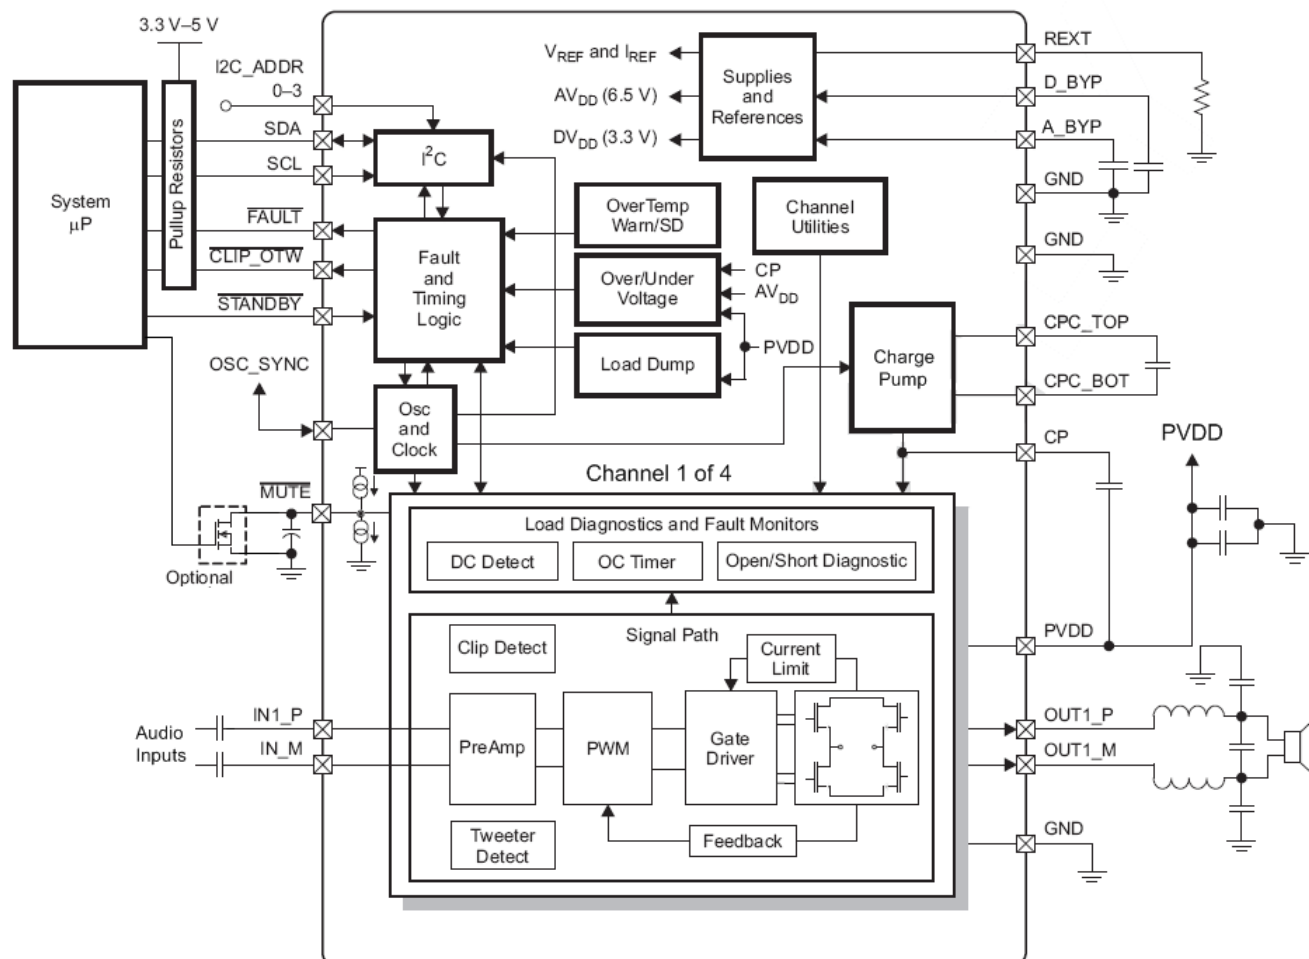

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

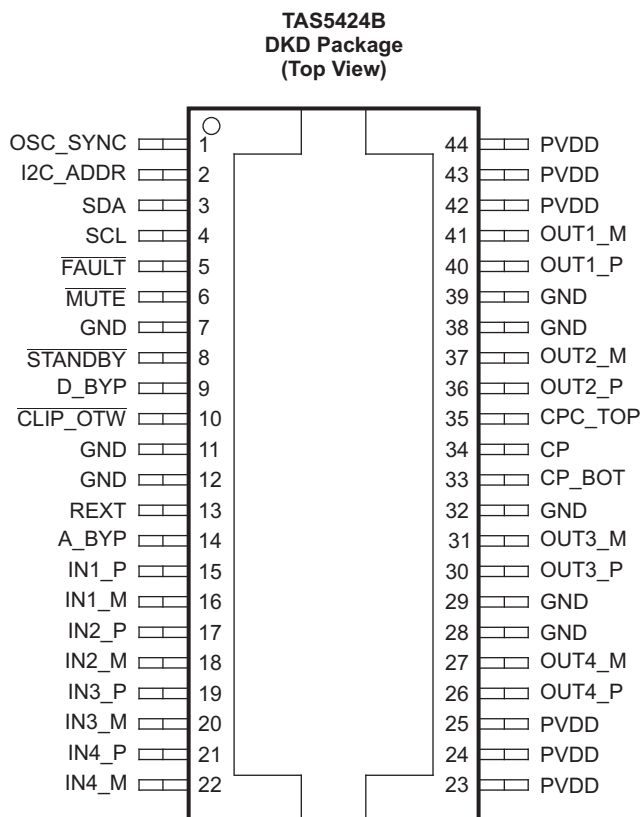

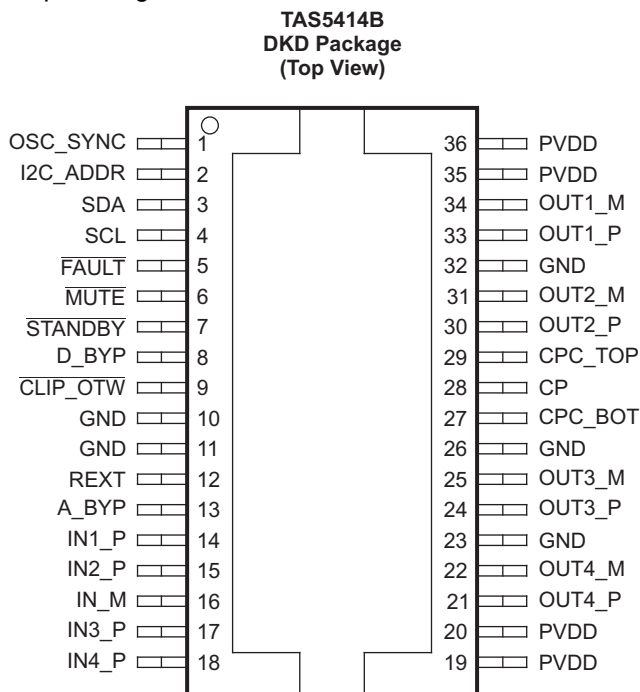

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

FUNCTIONAL BLOCK DIAGRAM

PIN ASSIGNMENTS AND FUNCTIONS

The pin assignments are shown as follows.

TAS5414B
PHD Package
(Top View)

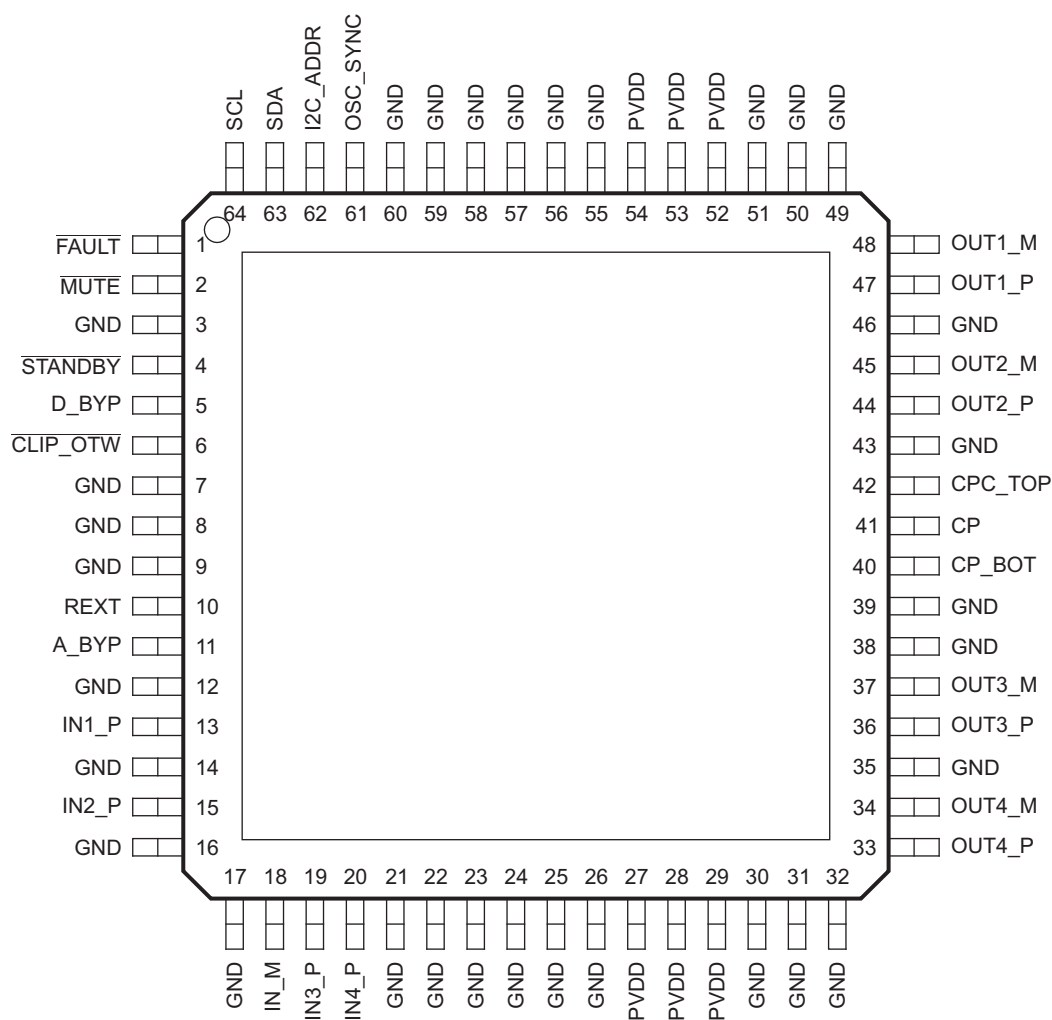

Table 1. PIN FUNCTIONS

NAME	PIN			TYPE ⁽¹⁾	DESCRIPTION
	DKD/DKE PACKAGE	PHD PACKAGE			
	TAS5414B-Q1 NO.	TAS5424B-Q1 NO.	TAS5414B-Q1 NO.		
A_BYP	13	14	11	PBY	Bypass pin for the AVDD analog regulator
CLIP_OTW	9	10	6	DO	Reports CLIP, OTW, or both. It also reports tweeter detection during tweeter mode. Open-Drain.
CP	28	34	41	CP	Top of main storage capacitor for charge pump (bottom goes to PVDD)
CPC_BOT	27	33	40	CP	Bottom of flying capacitor for charge pump
CPC_TOP	29	35	42	CP	Top of flying capacitor for charge pump
D_BYP	8	9	5	PBY	Bypass pin for DVDD regulator output
FAULT	5	5	1	DO	Global fault output (open drain): UV, OV, OTSD, OCSD, DC
GND	10, 11, 23, 26, 32	7, 11, 12, 28, 29, 32, 38, 39	3, 7, 8, 9, 12, 14, 16, 17, 21, 22, 23, 24, 25, 26, 30, 31, 32, 35, 38, 39, 43, 46, 49, 50, 51, 55, 56, 57, 58, 59, 60	GND	Ground
I2C_ADDR	2	2	62	AI	I ² C address bit
IN1_M	N/A	16	N/A	AI	Inverting analog input for channel 1 (TAS5424B-Q1 only)
IN1_P	14	15	13	AI	Non-inverting analog input for channel 1
IN2_M	N/A	18	N/A	AI	Inverting analog input for channel 2 (TAS5424B-Q1 only)
IN2_P	15	17	15	AI	Non-inverting analog input for channel 2
IN3_M	N/A	20	N/A	AI	Inverting analog input for channel 3 (TAS5424B-Q1 only)
IN3_P	17	19	19	AI	Non-inverting analog input for channel 3
IN4_M	N/A	22	N/A	AI	Inverting analog input for channel 4 (TAS5424B-Q1 only)
IN4_P	18	21	20	AI	Non-inverting analog input for channel 4
IN_M	16	N/A	18	ARTN	Signal return for the 4 analog channel inputs (TAS5414B-Q1 only)
MUTE	6	6	2	AI	Gain ramp control: mute (low), play (high)
OSC_SYNC	1	1	61	DI/DO	Oscillator input from master or output to slave amplifiers
OUT1_M	34	41	48	PO	– polarity output for bridge 1
OUT1_P	33	40	47	PO	+ polarity output for bridge 1
OUT2_M	31	37	45	PO	– polarity output for bridge 2
OUT2_P	30	36	44	PO	+ polarity output for bridge 2
OUT3_M	25	31	37	PO	– polarity output for bridge 3
OUT3_P	24	30	36	PO	+ polarity output for bridge 3
OUT4_M	22	27	34	PO	– polarity output for bridge 4
OUT4_P	21	26	33	PO	+ polarity output for bridge 4
PVDD	19, 20, 35, 36	23, 24, 25, 42, 43, 44	27, 28, 29, 52, 53, 54	PWR	PVDD supply
REXT	12	13	10	AI	Precision resistor pin to set analog reference
SCL	4	4	64	DI	I ² C clock input from system I ² C master
SDA	3	3	63	DI/DO	I ² C data I/O for communication with system I ² C master
STANDBY	7	8	4	DI	Active-low STANDBY pin. Standby (low), power up (high)

(1) DI = digital input, DO = digital output, AI = analog input, ARTN = analog signal return, PWR = power supply, PBY = power bypass, PO = power output, GND = ground, CP = charge pump.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)

			VALUE	UNIT
PVDD	DC supply voltage range	Relative to GND	–0.3 to 30	V
PVDD _{MAX}	Pulsed supply voltage range	$t \leq 100$ ms exposure	–1 to 50	V
PVDD _{RAMP}	Supply voltage ramp rate		15	V/ms
I _{PVDD}	Externally imposed dc supply current per PVDD or GND pin		±12	A
I _{PVDD_MAX}	Pulsed supply current per PVDD pin (one shot)	$t < 100$ ms	17	A
I _O	Maximum allowed dc current per output pin		±13.5	A
I _{O_MAX} ⁽¹⁾	Pulsed output current per output pin (single pulse)	$t < 100$ ms	±17	A
I _{IN_MAX}	Maximum current, all digital and analog input pins ⁽²⁾	DC or pulsed	±1	mA
I _{MUTE_MAX}	Maximum current on $\overline{\text{MUTE}}$ pin	DC or pulsed	±20	mA
I _{IN_ODMAX}	Maximum sink current for open-drain pins		7	mA
V _{LOGIC}	Input voltage range for pin relative to GND (SCL, SDA, I2C_ADDR pins)	Supply voltage range: 6 V < PVDD < 24 V	–0.3 to 6	V
V _{MUTE}	Voltage range for $\overline{\text{MUTE}}$ pin relative to GND	Supply voltage range: 6 V < PVDD < 24 V	–0.3 to 7.5	V
V _{STANDBY}	Input voltage range for $\overline{\text{STANDBY}}$ pin	Supply voltage range: 6 V < PVDD < 24 V	–0.3 to 5.5	V
V _{OSC_SYNC}	Input voltage range for OSC_SYNC pin relative to GND	Supply voltage range: 6 V < PVDD < 24 V	–0.3 to 3.6	V
V _{GND}	Maximum voltage between GND pins		±0.3	V
V _{AIN_AC_MAX_5414}	Maximum ac-coupled input voltage for TAS5414B-Q1 ⁽²⁾ , analog input pins	Supply voltage range: 6 V < PVDD < 24 V	1.9	V _{rms}
V _{AIN_AC_MAX_5424}	Maximum ac-coupled differential input voltage for TAS5424B-Q1 ⁽²⁾ , analog input pins	Supply voltage range: 6 V < PVDD < 24 V	3.8	V _{rms}
T _J	Maximum operating junction temperature range		–55 to 150	°C
T _{stg}	Storage temperature range		–55 to 150	°C

(1) Pulsed current ratings are maximum survivable currents externally applied to the device. High currents may be encountered during reverse battery, fortuitous open ground, and fortuitous open supply fault conditions.

(2) See [Application Information](#) section for information on analog input voltage and ac coupling.

THERMAL CHARACTERISTICS

PARAMETER	VALUE (Typical)	UNIT
R _{θJC} Junction-to-case (heat slug) thermal resistance, DKD package	1.0	°C/W
R _{θJC} Junction-to-case (heat slug) thermal resistance, PHD package	1.2	
R _{θJA} Junction-to-ambient thermal resistance	This device is not intended to be used without a heatsink. Therefore, R _{θJA} is not specified. See the Thermal Information section.	
Exposed pad dimensions, DKD package	13.8 × 5.8	mm
Exposed pad dimensions, PHD package	8 × 8	

ELECTROSTATIC DISCHARGE (ESD)

PARAMETER	Package	Pins	VALUE (Typical)	UNIT
Human Body Model (HBM) AEC-Q100-002	All	All	3000	V
Charged Device Model (CDM) AEC-Q100-011	DKD/DKE	Corner Pins excluding OSC_SYNC	1000	
		All other pins (including OSC_SYNC) except CP pin	500	
		CP Pin (Non-Corner Pin)	400	
	PHD	Corner Pins excluding SCL	750	
		All Pins (including SCL) except CP and CP_Top	600	
		CP and CP_Top Pins	400	
Machine Model (MM) AEC-Q100-003	DKD/DKE		150	
	PHD		100	

RECOMMENDED OPERATING CONDITIONS⁽¹⁾

			MIN	TYP	MAX	UNIT
PVDD _{OP}	DC supply voltage range relative to GND		6	14.4	24	V
V _{AIN_5414} ⁽²⁾	Analog audio input signal level (TAS5414B-Q1)	AC-coupled input voltage	0		0.25–1 ⁽³⁾	Vrms
V _{AIN_5424} ⁽²⁾	Analog audio input signal level (TAS5424B-Q1)	AC-coupled input voltage	0		0.5–2 ⁽³⁾	Vrms
T _A	Ambient temperature		–40		105	°C
T _J	Junction temperature	An adequate heat sink is required to keep T _J within specified range.	–40		115	°C
R _L	Nominal speaker load impedance		2	4		Ω
V _{PU}	Pullup voltage supply (for open-drain logic outputs)		3	3.3 or 5	5.5	V
R _{PU_EXT}	External pullup resistor on open-drain logic outputs	Resistor connected between open-drain logic output and V _{PU} supply	10		50	kΩ
R _{PU_I2C}	I ² C pullup resistance on SDA and SCL pins		1	4.7	10	kΩ
R _{I2C_ADD}	Total resistance of voltage divider for I ² C address slave 1 or slave 2, connected between D_BYP and GND pins		10		50	kΩ
R _{REXT}	External resistance on REXT pin	1% tolerance required	19.8	20	20.2	kΩ
C _{D_BYP} , C _{A_BYP}	External capacitance on D_BYP and A_BYP pins		10		120	nF
C _{OUT}	External capacitance to GND on OUT_X pins			150	680	nF
C _{IN}	External capacitance to analog input pin in series with input signal			0.47		μF
C _{FLY}	Flying capacitor on charge pump		0.47	1	1.5	μF
C _P	Charge pump capacitor	50V needed for Load Dump	0.47	1	1.5	μF
C _{MUTE}	MUTE pin capacitor		100	220	1000	nF
C _{OSCSYNC_MAX}	Allowed loading capacitance on OSC_SYNC pin			75		pF

- (1) The *Recommended Operating Conditions* table specifies only that the device is functional in the given range. See the *Electrical Characteristics* table for specified performance limits.
- (2) Signal input for full unclipped output with gains of 32 dB, 26 dB, 20 dB, and 12 dB
- (3) Maximum recommended input voltage is determined by the gain setting.

ELECTRICAL CHARACTERISTICS

Test conditions (unless otherwise noted): $T_{Case} = 25^{\circ}C$, $PVDD = 14.4 V$, $R_L = 4 \Omega$, $f_S = 417 kHz$, $P_{out} = 1 W/ch$, $R_{ext} = 20 k\Omega$, AES17 Filter, default I²C settings, master mode operation (see application diagram)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
OPERATING CURRENT						
IPVDD_IDLE	PVDD idle current	All four channels in MUTE mode	170	220	mA	
IPVDD_HI-Z		All four channels in Hi-Z mode	93			
IPVDD_STBY	PVDD standby current	STANDBY mode, T _J ≤ 85°C	2	10	µA	
OUTPUT POWER						
P _{OUT}	Output power per channel	4 Ω, PVDD = 14.4 V, THD+N ≤ 1%, 1 kHz, T _c = 75°C	23		W	
		4 Ω, PVDD = 14.4 V, THD+N = 10%, 1 kHz, T _c = 75°C	25	28		
		4 Ω, PVDD = 24 V, THD+N = 10%, 1 kHz, T _c = 75°C	63	79		
		2 Ω, PVDD = 14.4 V, THD+N = 1%, 1 kHz, T _c = 75°C	38			
		2 Ω, PVDD = 14.4 V, THD+N = 10%, 1 kHz, T _c = 75°C	40	50		
		PBTL 2-Ω operation, PVDD = 24 V, THD+N = 10%, 1 kHz, T _c = 75°C	150			
		PBTL 1-Ω operation, PVDD = 14.4 V, THD+N = 10%, 1 kHz, T _c = 75°C	90			
EFF _P	Power efficiency	4 channels operating, 23-W output power/ch, L = 10 µH, T _J ≤ 85°C	90%			
AUDIO PERFORMANCE						
V _{NOISE}	Noise voltage at output	Zero input, and A-weighting	60	100	µV	
Crosstalk	Channel crosstalk	P = 1W, f = 1 kHz, Enhanced Crosstalk Enabled via I ² C (reg 0x10)	70	85	dB	
CMRR ₅₄₂₄	Common-mode rejection ratio (TAS5424B-Q1)	f = 1 kHz, 1 Vrms referenced to GND, G = 26 dB	60	75	dB	
PSRR	Power supply rejection ratio	PVDD = 14.4 Vdc + 1 Vrms, f = 1 kHz	60	75	dB	
THD+N	Total harmonic distortion + noise	P = 1W, f = 1 kHz	0.02%	0.1%		
f _S	Switching frequency	Switching frequency selectable for AM interference avoidance	336	357	378	kHz
			392	417	442	
			470	500	530	
R _{AIN}	Analog input resistance	Internal shunt resistance on each input pin	63	85	106	kΩ
V _{IN_CM}	Common-mode input voltage	AC coupled common-mode input voltage (zero differential input)	1.3		Vrms	
V _{CM_INT}	Internal common-mode input bias voltage	Internal bias applied to IN_M pin	3.3		V	
G	Voltage gain (V _O /V _{IN})	Source impedance = 0 Ω, gain measurement taken at 1 W of power per channel	11	12	13	dB
			19	20	21	
			25	26	27	
			31	32	33	
G _{CH}	Channel-to-channel variation	Any gain commanded	−1	0	1	dB
PWM OUTPUT STAGE						
R _{DSon}	FET drain-to-source resistance	Not including bond wire resistance, T _J = 25°C	65	90	mΩ	
V _{O_OFFSET}	Output offset voltage	Zero input signal, G = 26 dB	±10	±50	mV	
PVDD OVERVOLTAGE (OV) PROTECTION						
V _{OV_SET}	PVDD overvoltage shutdown set		24.6	26.4	28.2	V
V _{OV_CLEAR}	PVDD overvoltage shutdown clear		24.4	25.9	27.4	
PVDD UNDERVOLTAGE (UV) PROTECTION						
V _{UV_SET}	PVDD undervoltage shutdown set		4.9	5.3	5.6	V
V _{UV_CLEAR}	PVDD undervoltage shutdown clear		6.2	6.6	7.0	V
AVDD						
V _{A_BYP}	A_BYP pin voltage		6.5		V	
V _{A_BYP_UV_SET}	A_BYP UV voltage		4.8		V	
V _{A_BYP_UV_CLEAR}	Recovery voltage A_BYP UV		5.3		V	
DVDD						
V _{D_BYP}	D_BYP pin voltage		3.3		V	

ELECTRICAL CHARACTERISTICS (continued)

Test conditions (unless otherwise noted): $T_{Case} = 25^{\circ}C$, $PVDD = 14.4\text{ V}$, $R_L = 4\ \Omega$, $f_S = 417\text{ kHz}$, $P_{out} = 1\text{ W/ch}$, $R_{ext} = 20\text{ k}\Omega$, AES17 Filter, default I²C settings, master mode operation (see application diagram)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER-ON RESET (POR)						
V _{POR}	PVDD voltage for POR	I ² C active above this voltage			3.5	V
V _{POR_HY}	PVDD recovery hysteresis voltage for POR			0.1		V
REXT						
V _{REXT}	Rext pin voltage			1.27		V
CHARGE PUMP (CP)						
V _{CPUV_SET}	CP undervoltage			4.8		V
V _{CPUV_CLEAR}	Recovery voltage for CP UV			4.9		V
OVERTEMPERATURE (OT) PROTECTION						
T _{OTW1_CLEAR}	Junction temperature for overtemperature warning		96	112	128	°C
T _{OTW1_SET} / T _{OTW2_CLEAR}			106	122	138	
T _{OTW2_SET} / T _{OTW3_CLEAR}			116	132	148	
T _{OTW3_SET} / T _{OTSD_CLEAR}			126	142	158	
T _{OTSD}	Junction temperature for overtemperature shutdown		136	152	168	
T _{FB}	Junction temperature for overtemperature foldback	Per channel	130	150	170	
CURRENT LIMITING PROTECTION						
I _{LIM}	Current limit (load current)	Level 1	5.5	7.3	9.0	A
		Level 2 (default)	10.6	12.7	15.0	
OVERCURRENT (OC) SHUTDOWN PROTECTION						
I _{MAX}	Maximum current (peak output current)	Level 1	7.8	9.8	12.2	A
		Level 2 (default), Any short to supply, ground, or other channels	11.9	14.8	17.7	
TWEETER DETECT						
I _{TH_TW}	Load current threshold for tweeter detect		330	445	560	mA
I _{LIM_TW}	Load current limit for tweeter detect			2.1		A
STANDBY MODE						
V _{IH_STBY}	$\overline{\text{STANDBY}}$ input voltage for logic-level high		2			V
V _{IL_STBY}	$\overline{\text{STANDBY}}$ input voltage for logic-level low				0.7	V
I _{STBY_PIN}	$\overline{\text{STANDBY}}$ pin current			0.1	0.2	μA
MUTE MODE						
G _{MUTE}	Output attenuation	$\overline{\text{MUTE}}$ pin ≤ 0.5 V + 200mS or I ² C Mute Enabled		100		dB
DC DETECT						
V _{TH_DC_TOL}	DC detect threshold tolerance			25		%
t _{DCD}	DC detect step response time for four channels				5.3	s
CLIP_OTW REPORT						
V _{OH_CLIPOTW}	$\overline{\text{CLIP_OTW}}$ pin output voltage for logic level high (open-drain logic output)	External 47-kΩ pullup resistor to 3 V–5.5 V	2.4			V
V _{OL_CLIPOTW}	$\overline{\text{CLIP_OTW}}$ pin output voltage for logic level low (open-drain logic output)				0.5	V
t _{DELAY_CLIPDET}	$\overline{\text{CLIP_OTW}}$ signal delay when output clipping detected				20	μs
FAULT REPORT						
V _{OH_FAULT}	$\overline{\text{FAULT}}$ pin output voltage for logic-level high (open-drain logic output)	External 47-kΩ pullup resistor to 3 V–5.5 V	2.4			V
V _{OL_FAULT}	$\overline{\text{FAULT}}$ pin output voltage for logic-level low (open-drain logic output)				0.5	
OPEN/SHORT DIAGNOSTICS						

ELECTRICAL CHARACTERISTICS (continued)

Test conditions (unless otherwise noted): $T_{Case} = 25^{\circ}C$, $PVDD = 14.4\text{ V}$, $R_L = 4\ \Omega$, $f_S = 417\text{ kHz}$, $P_{out} = 1\text{ W/ch}$, $R_{ext} = 20\text{ k}\Omega$, AES17 Filter, default I²C settings, master mode operation (see application diagram)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
R _{S2P} , R _{S2G}	Maximum resistance to detect a short from OUT pin(s) to PVDD or ground				200	Ω
R _{OPEN_LOAD}	Minimum load resistance to detect open circuit	Including speaker wires	300	740	1300	Ω
R _{SHORTED_LOAD}	Maximum load resistance to detect short circuit	Including speaker wires	0.5	1.0	1.5	Ω
I ² C ADDRESS DECODER						
t _{LATCH_I2CADDR}	Time delay to latch I ² C address after POR		300			μs
V _{I2C_ADDR}	Voltage on I2C_ADDR pin for address 0	Connect to GND	0%	0%	15%	V _{D_BYP}
	Voltage on I2C_ADDR pin for address 1	External resistors in series between D_BYP and GND as a voltage divider	25%	35%	45%	
	Voltage on I2C_ADDR pin for address 2		55%	65%	75%	
	Voltage on I2C_ADDR pin for address 3	Connect to D_BYP	85%	100%	100%	
I ² C						
t _{HOLD_I2C}	Power-on hold time before I ² C communication	$\overline{\text{STANDBY}}$ high	1			ms
f _{SCL}	SCL clock frequency		400			kHz
V _{IH_SCL}	SCL pin input voltage for logic-level high	R _{PU_I2C} = 5-kΩ pullup, supply voltage = 3.3 V or 5 V	2.1	5.5		V
V _{IL_SCL}	SCL pin input voltage for logic-level low		−0.5	1.1		V
V _{OH_SDA}	SDA pin output voltage for logic-level high	I ² C read, R _{I2C} = 5-kΩ pullup, supply voltage = 3.3 V or 5 V	2.4			V
V _{OL_SDA}	SDA pin output voltage for logic-level low	I ² C read, 3-mA sink current	0.4			V
V _{IH_SDA}	SDA pin input voltage for logic-level high	I ² C write, R _{I2C} = 5-kΩ pullup, supply voltage = 3.3 V or 5 V	2.1	5.5		V
V _{IL_SDA}	SDA pin input voltage for logic-level low	I ² C write, R _{I2C} = 5-kΩ pullup, supply voltage = 3.3 V or 5 V	−0.5	1.1		V
C _i	Capacitance for SCL and SDA pins		10			pF
OSCILLATOR						
V _{OH_OSCSYNC}	OSC_SYNC pin output voltage for logic-level high	I2C_ADDR pin set to MASTER mode	2.4			V
V _{OL_OSCSYNC}	OSC_SYNC pin output voltage for logic-level low		0.5			V
V _{IH_OSCSYNC}	OSC_SYNC pin input voltage for logic-level high	I2C_ADDR pin set to SLAVE mode	2			V
V _{IL_OSCSYNC}	OSC_SYNC pin input voltage for logic-level low		0.8			V
f _{OSC_SYNC}	OSC_SYNC pin clock frequency	I2C_ADDR pin set to MASTER mode, f _S = 500 kHz	3.76	4.0	4.24	MHz
		I2C_ADDR pin set to MASTER mode, f _S = 417 kHz	3.13	3.33	3.63	
		I2C_ADDR pin set to MASTER mode, f _S = 357 kHz	2.68	2.85	3.0	

TIMING REQUIREMENTS FOR I²C INTERFACE SIGNALS

over recommended operating conditions (unless otherwise noted)

PARAMETER	MIN	TYP	MAX	UNIT
t_r Rise time for both SDA and SCL signals			300	ns
t_f Fall time for both SDA and SCL signals			300	ns
$t_{w(H)}$ SCL pulse duration, high	0.6			μ s
$t_{w(L)}$ SCL pulse duration, low	1.3			μ s
t_{su2} Setup time for START condition	0.6			μ s
t_{h2} START condition hold time after which first clock pulse is generated	0.6			μ s
t_{su1} Data setup time	100			ns
t_{h1} Data hold time	0 ⁽¹⁾			ns
t_{su3} Setup time for STOP condition	0.6			μ s
C_B Load capacitance for each bus line			400	pF

- (1) A device must internally provide a hold time of at least 300 ns for the SDA signal to bridge the undefined region of the falling edge of SCL.

DESCRIPTION OF OPERATION

OVERVIEW

The TAS5414B-Q1 and TAS5424B-Q1 are single-chip, four-channel, analog-input audio amplifiers for use in the automotive environment. The design uses an ultra-efficient class-D technology developed by Texas Instruments, but with changes needed by the automotive industry. This technology allows for reduced power consumption, reduced heat, and reduced peak currents in the electrical system. The device realizes an audio sound system design with smaller size and lower weight than traditional class-AB solutions.

There are eight core design blocks:

- Preamplifier
- PWM
- Gate drive
- Power FETs
- Diagnostics
- Protection
- Power supply
- I²C serial communication bus

Preamplifier

The preamplifier is a high-input-impedance, low-noise, low-offset-voltage input stage with adjustable gain. The high input impedance allows the use of low-cost input capacitors while still achieving extended low-frequency response. The preamplifier is powered by a dedicated, internally regulated supply, which gives it excellent noise immunity and channel separation. Also included in the preamp are:

1. **Mute Pop-and-Click Control**— The device ramps the gain gradually when a mute or play command is received. Another form of click and pop can be caused by the start or stopping of switching in a class-D amplifier. The TAS5414B-Q1 and TAS5424B-Q1 incorporate a patented method to reduce the pop energy during the switching startup and shutdown sequence. Fault conditions require rapid protection response by the TAS5414B-Q1 and the TAS5424B-Q1, which do not have time to ramp the gain down in a pop-free manner. The device transitions into Hi-Z mode when an OV, UV, OC, OT, or DC fault is encountered. Also, activation of the STANDBY pin may not be pop-free.
2. **Gain Control**—The four gain settings are set in the preamplifier via I²C control registers. The gain is set outside of the global feedback resistors of the device, thus allowing for stability of the system at all gain settings with properly loaded conditions.

Pulse-Width Modulator (PWM)

The PWM converts the analog signal from the preamplifier into a switched signal of varying duty cycle. This is the critical stage that defines the class-D architecture. In the TAS5414B-Q1 and TAS5424B-Q1, the modulator is an advanced design with high bandwidth, low noise, low distortion, excellent stability, and full 0–100% modulation capability. The patented PWM uses clipping recovery circuitry to eliminate the deep saturation characteristic of PWMs when the input signal exceeds the modulator waveform.

Gate Drive

The gate driver accepts the low-voltage PWM signal and level shifts it to drive a high-current, full-bridge, power FET stage. The device uses proprietary techniques to optimize EMI and audio performance.

Power FETs

The BTL output for each channel comprises four rugged N-channel 30-V 65 mΩ FETs for high efficiency and maximum power transfer to the load. These FETs are designed to handle large voltage transients during load dump.

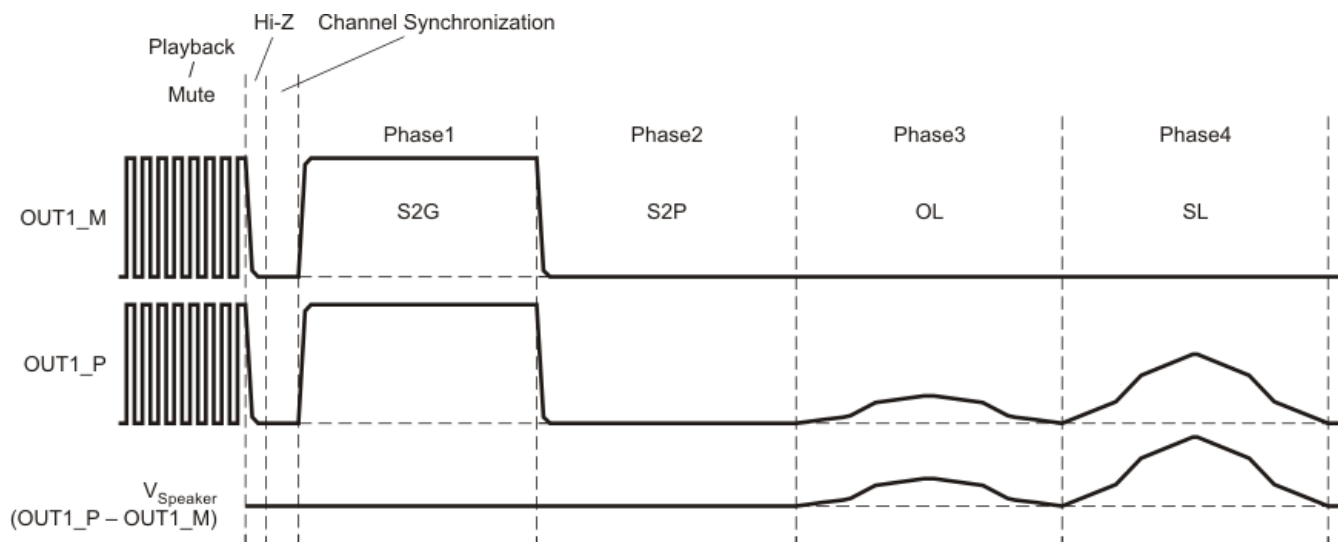

Load Diagnostics

The device incorporates load diagnostic circuitry designed to help pinpoint the nature of output misconnections during installation. The TAS5414B-Q1 and the TAS5424B-Q1 include functions for detecting and determining the status of output connections. The following diagnostics are supported:

- Short to GND
- Short to PVDD
- Short across load
- Open load
- Tweeter detection

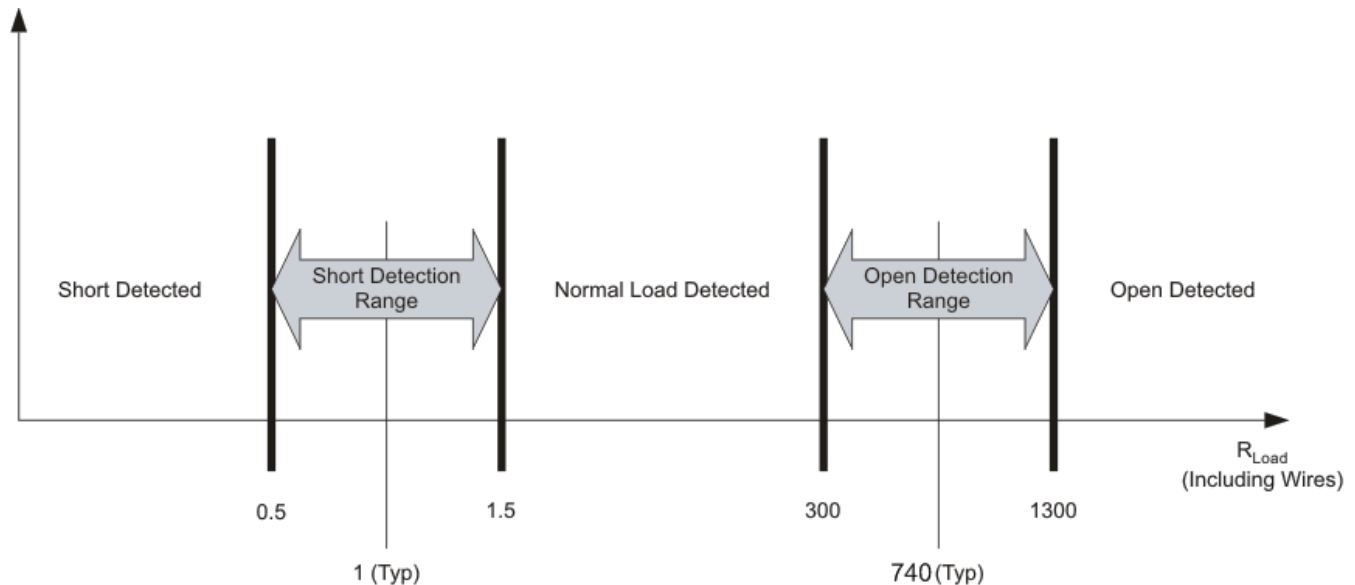

The presence of any of the short or open conditions is reported to the system via I²C register read. The tweeter detect status can be read from the CLIP_OTW pin when properly configured.

1. **Output Short and Open Diagnostics**—The device contains circuitry designed to detect shorts and open conditions on the outputs. The load diagnostic function can only be invoked when the output is in the Hi-Z mode. There are four phases of test during load diagnostics and two levels of test. In the full level, all channels must be in the Hi-Z state. All four phases are tested on each channel, all four channels at the same time. When fewer than four channels are in Hi-Z, the reduced level of test is the only available option. In the reduced level, only short to PVDD and short to GND can be tested. Load diagnostics can occur at power up before the amplifier is moved out of Hi-Z mode. If the amplifier is already in play mode, it must *Mute* and then *Hi-Z* before the load diagnostic can be performed. By performing the mute function, the normal pop- and click-free transitions occur before the diagnostics begin. The diagnostics are performed as shown in Figure 11. Figure 12 shows the impedance ranges for the open-load and shorted-load diagnostics. The results of the diagnostic are read from the diagnostic register for each channel via I²C. With the default settings and MUTE capacitor the S2G and S2P phase take ~20mS each, the OL phase takes ~100mS, and the SL takes ~230mS.

2. **Tweeter Detection**—Tweeter detection is an alternate operating mode that is used to determine the proper connection of a frequency dependent load (such as a speaker with a crossover). Tweeter detection is invoked via I²C, and all four channels should be tested individually. Tweeter detection uses the average cycle-by-cycle current limit circuit (see [CBC](#) section) to measure the current delivered to the load. The proper implementation of this diagnostic function is dependent on the amplitude of a user-supplied test signal and on the impedance versus frequency curve of the acoustic load. The system (external to the TAS5414B-Q1 and TAS5424B-Q1) must generate a signal to which the load will respond. The frequency and amplitude of this signal must be calibrated by the user to result in a current draw that is greater than the tweeter detection threshold when the load under test is present, and less than the detection threshold if the load is not properly connected. The current level for the tweeter detection threshold, as well as the maximum current that can safely be delivered to a load when in tweeter detection mode, can be found in the Electrical Characteristics section of the datasheet. The tweeter detection results are reported on the CLIP_OTW pin during the application of the test signal. When tweeter detection is activated (indicating that the tested load is present), pulses on the CLIP_OTW pin begin to toggle. The pulses on the CLIP_OTW pins will report low whenever the current detection threshold is exceeded, and the pin will remain low until the threshold is no longer exceeded. The minimum low-pulse period that can be expected is equal to one period of the switching frequency. Having an input signal that increases the amount of time that the detector is activated (e. g. increasing the amplitude of the input signal) will increase the amount of time for which the pin reports low.
NOTE: Because tweeter detection is an alternate *operating mode*, the channels to be tested must be placed in Play mode (via register 0x0C) after tweeter detection has been activated in order to commence the detection process. Additionally, the CLIP_OTW pin must be set up via register 0x0A to report the results of tweeter detection.

Protection and Monitoring

1. **Cycle-By-Cycle Current Limit (CBC)**—The CBC current-limiting circuit terminates each PWM pulse to limit the output current flow when the average current limit (I_{LIM}) threshold is exceeded. The overall effect on the audio in the case of a current overload is quite similar to a voltage-clipping event, where power is temporarily limited at the peaks of the musical signal and normal operation continues without disruption when the overload is removed. The TAS5414B-Q1 and TAS5424B-Q1 do not prematurely shut down in this condition. All four channels continue in play mode and pass signal.
2. **Overcurrent Shutdown (OCS)**—Under severe short-circuit events, such as a short to PVDD or ground, a peak-current detector is used, and the affected channel shuts down in 200 μ s to 390 μ s if the conditions are severe enough. The shutdown speed depends on a number of factors, such as the impedance of the short circuit, supply voltage, and switching frequency. Only the shorted channels are shut down in such a scenario.

The user may restart the affected channel via I²C. An OCSD event activates the fault pin, and the affected channel(s) are recorded in the I²C fault register. If the supply or ground short is strong enough to exceed the peak current threshold but not severe enough to trigger the OCSD, the peak current limiter prevents excess current from damaging the output FETs, and operation returns to normal after the short is removed.

3. **DC Detect**—This circuit detects a dc offset continuously during normal operation at the output of the amplifier. If the dc offset reaches the level defined in the I²C registers for the specified time period, the circuit triggers. By default a dc detection event does not shut the output down. The shutdown function can be enabled or disabled via I²C. If enabled, the triggered channel shuts down, but the others remain playing and the **FAULT** pin is asserted. The dc level is defined in I²C registers.
4. **Clip Detect**—The clip detect circuit alerts the user to the presence of a 100% duty-cycle PWM due to a clipped waveform. When this occurs, a signal is passed to the **CLIP_OTW** pin and it is asserted until the 100% duty-cycle PWM signal is no longer present. All four channels are connected to the same **CLIP_OTW** pin. Through I²C, the **CLIP_OTW** signal can be changed to clip-only, OTW-only, or both. A fourth mode, used only during diagnostics, is the option to report tweeter detection events on this pin (see the [Tweeter Detection](#) section). The microcontroller in the system can monitor the signal at the **CLIP_OTW** pin and may be configured to reduce the volume to all four channels in an active clipping-prevention circuit.
5. **Overtemperature Warning (OTW), Overtemperature Shutdown (OTSD) and Thermal Foldback**—By default, the **CLIP_OTW** pin is set to indicate an OTW. This can be changed via I²C commands. If selected to indicate a temperature warning, the **CLIP_OTW** pin is asserted when the die temperature reaches warning level 1 as shown in the electrical specs. The OTW has three temperature thresholds with a 10°C hysteresis. Each threshold is indicated in I²C register 0x04 bits 5, 6, and 7. The device still functions until the temperature reaches the OTSD threshold, at which time the outputs are placed into Hi-Z mode and the **FAULT** pin is asserted. I²C is still active in the event of an OTSD and the registers can be read for faults, but all audio ceases abruptly. After the OTSD resets the device can be turned back on through I²C. The OTW is still indicated until the temperature drops below warning level 1. The Thermal Foldback decreases the channel gain.
6. **Undervoltage (UV) and Power-on-Reset (POR)**—The undervoltage (UV) protection detects low voltages on PVDD, AVDD, and CP. In the event of an undervoltage, the **FAULT** pin is asserted and the I²C register is updated, depending on which voltage caused the event. Power-on-reset (POR) occurs when PVDD drops low enough. A POR event causes the I²C to go into a high-impedance state. After the device recovers from the POR event, the device must be re-initialized via I²C.
7. **Overvoltage (OV) and Load Dump**—The OV protection detects high voltages on PVDD. If PVDD reaches the overvoltage threshold, the **FAULT** pin is asserted and the I²C register is updated. The device can withstand 50-V load-dump voltage spikes. Also depicted in this graph are the voltage thresholds for normal operation region, overvoltage operation region, and load-dump protection region. [Figure 11](#) shows the regions of operating voltage and the profile of the load dump event.

Power Supply

The power for the device is most commonly provided by a car battery that can have a large voltage range. PVDD is a filtered battery voltage, and it is the supply for the output FETs and the low-side FET gate driver. The high-side FET gate driver is supplied by a charge pump (CP) supply. The charge pump supplies the gate drive voltage for all four channels. The analog circuitry is powered by AVDD, which is provided by an internal linear regulator. A 0.1µF/10V external bypass capacitor is needed at the A_BYP pin for this supply. It is recommended that no external components except the bypass capacitor be attached to this pin. The digital circuitry is powered by DVDD, which is provided by an internal linear regulator. A 0.1µF/10V external bypass capacitor is needed at the D_BYP pin. It is recommended that no external components except the bypass capacitor be attached to this pin.

The TAS5414B-Q1 and TAS5424B-Q1 can withstand fortuitous open ground and power conditions. Fortuitous open ground usually occurs when a speaker wire is shorted to ground, allowing for a second ground path through the body diode in the output FETs. The diagnostic capability allows the speakers and speaker wires to be debugged, eliminating the need to remove the amplifier to diagnose the problem.

I²C Serial Communication Bus

The device communicates with the system processor via the I²C serial communication bus as an I²C slave-only device. The processor can poll the device via I²C to determine the operating status. All fault conditions and detections are reported via I²C. There are also numerous features and operating conditions that can be set via I²C.

The I²C bus allows control of the following configurations:

- Independent gain control of each channel. The gain can be set to 12 dB, 20 dB, 26 dB, and 32 dB.
- Select AM non-interference switching frequency
- Select the function of OTW_CLIP pin
- Enable or disable dc detect function with selectable threshold
- Place channel in Hi-Z (switching stopped) mode (mute)
- Select tweeter detect, set detect threshold and initiate function
- Initiate open/short load diagnostic
- Reset faults and return to normal switching operation from Hi-Z mode (unmute)

In addition to the standard SDA and SCL pins for the I²C bus, the TAS5414B-Q1 and the TAS5424B-Q1 include a single pin that allows up to four devices to work together in a system with no additional hardware required for communication or synchronization. The I2C_ADDR pin sets the device in master or slave mode and selects the I²C address for that device. Tie I2C_ADDR to DGND for master, to 1.2 Vdc for slave 1, to 2.4 Vdc for slave 2, and to D_BYP for slave 3. The OSC_SYNC pin is used to synchronize the internal clock oscillators and thereby avoid beat frequencies. An external oscillator can also be applied to this pin for external control of the switching frequency.

Table 2. Table 7. I2C_ADDR Pin Connection

DESCRIPTION	I2C_ADDR PIN CONNECTION	I ² C ADDRESS
TAS5414B-Q1/5424 0 (OSC MASTER)	To SGND pin	0xD8/D9
TAS5414B-Q1/5424 1 (OSC SLAVE1)	35% DVDD (resistive voltage divider between D_BYP pin and SGND pin) ⁽¹⁾	0xDA/DB
TAS5414B-Q1/5424 2 (OSC SLAVE2)	65% DVDD (resistive voltage divider between D_BYP pin and SGND pin) ⁽¹⁾	0xDC/DD
TAS5414B-Q1/5424 3 (OSC SLAVE3)	To D_BYP pin	0xDE/DF

(1) R_{I2C_ADDR} with 5% or better tolerance is recommended.

I²C Bus Protocol

The TAS5414B-Q1 and TAS5424B-Q1 have a bidirectional serial control interface that is compatible with the Inter IC (I²C) bus protocol and supports 400-kbps data transfer rates for random and sequential write and read operations. This is a slave-only device that does not support a multimaster bus environment or wait state insertion. The control interface is used to program the registers of the device and to read device status.

The I²C bus employs two signals, SDA (data) and SCL (clock), to communicate between integrated circuits in a system. Data is transferred on the bus serially, one bit at a time. The address and data are transferred in byte (8-bit) format with the most-significant bit (MSB) transferred first. In addition, each byte transferred on the bus is acknowledged by the receiving device with an acknowledge bit. Each transfer operation begins with the master device driving a start condition on the bus and ends with the master device driving a stop condition on the bus. The bus uses transitions on the data terminal (SDA) while the clock is HIGH to indicate a start and stop conditions. A HIGH-to-LOW transition on SDA indicates a start, and a LOW-to-HIGH transition indicates a stop. Normal data bit transitions must occur within the low time of the clock period. These conditions are shown in [Figure 13](#). The master generates the 7-bit slave address and the read/write (R/W) bit to open communication with another device and then wait for an acknowledge condition. The TAS5414B-Q1 and TAS5424B-Q1 hold SDA LOW during the acknowledge-clock period to indicate an acknowledgment. When this occurs, the master

transmits the next byte of the sequence. Each device is addressed by a unique 7-bit slave address plus R/W bit (1 byte). All compatible devices share the same signals via a bidirectional bus using a wired-AND connection. An external pullup resistor must be used for the SDA and SCL signals to set the HIGH level for the bus. There is no limit on the number of bytes that can be transmitted between start and stop conditions. When the last word transfers, the master generates a stop condition to release the bus.

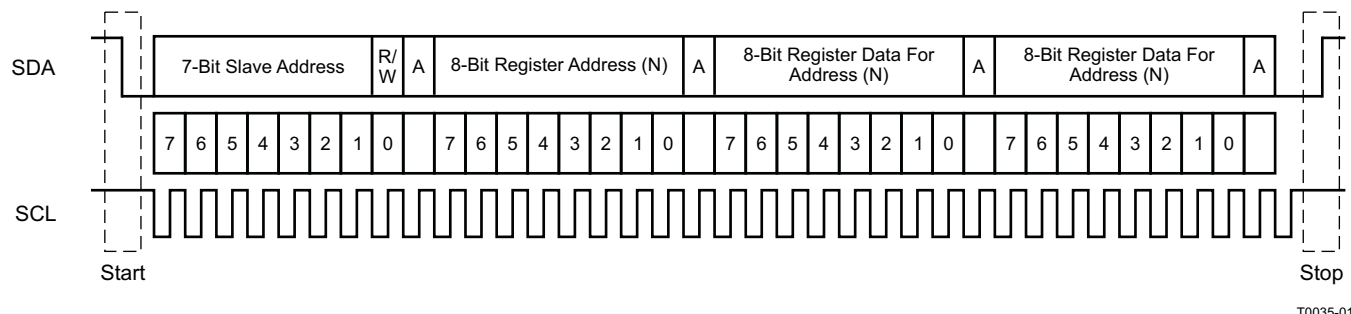

Figure 13. Typical I²C Sequence

Use the I2C_ADDR pin (pin 2) to program the device for one of four addresses. These four addresses are licensed I²C addresses and do not conflict with other licensed I²C audio devices. To communicate with the TAS5414B-Q1 and the TAS5424B-Q1, the I²C master uses addresses shown in Figure 13. Read and write data can be transmitted using single-byte or multiple-byte data transfers.

Random Write

As shown in Figure 14, a single-byte data-write transfer begins with the master device transmitting a start condition followed by the I²C device address and the read/write bit. The read/write bit determines the direction of the data transfer. For a write data transfer, the read/write bit is a 0. After receiving the correct I²C device address and the read/write bit, the TAS5414B-Q1 or TAS5424B-Q1 device responds with an acknowledge bit. Next, the master transmits the address byte or bytes corresponding to the internal memory address being accessed. After receiving the address byte, the TAS5414B-Q1 or TAS5424B-Q1 again responds with an acknowledge bit. Next, the master device transmits the data byte to be written to the memory address being accessed. After receiving the data byte, the TAS5414B-Q1 or TAS5424B-Q1 again responds with an acknowledge bit. Finally, the master device transmits a stop condition to complete the single-byte data-write transfer.

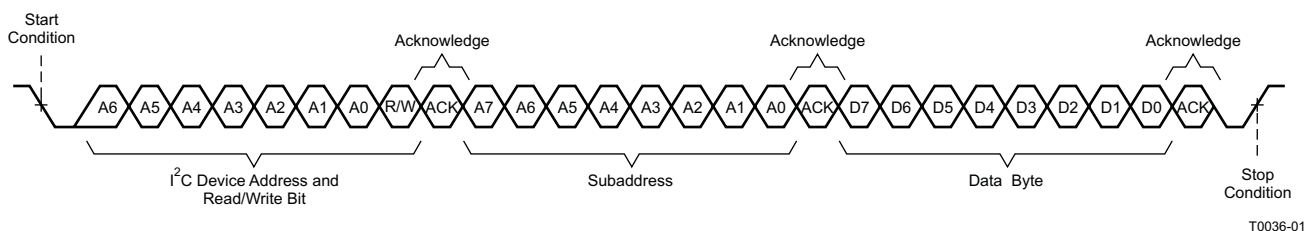

Figure 14. Random Write Transfer

Sequential Write

A sequential data-write transfer is identical to a single-byte data-write transfer except that multiple data bytes are transmitted by the master device to TAS5414B-Q1 or TAS5424B-Q1 as shown in Figure 14. After receiving each data byte, the TAS5414B-Q1 or TAS5424B-Q1 responds with an acknowledge bit and the I²C subaddress is automatically incremented by one.

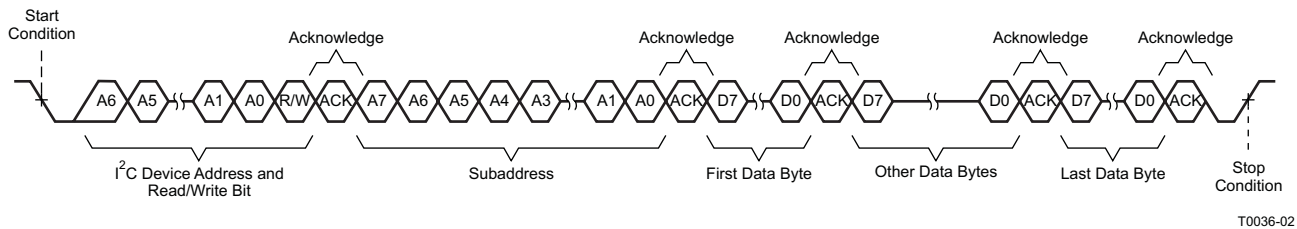

Figure 15. Sequential Write Transfer

Random Read

As shown in Figure 16, a single-byte data-read transfer begins with the master device transmitting a start condition followed by the I²C device address and the read/write bit. For the data-read transfer, both a write followed by a read are actually done. Initially, a write is done to transfer the address byte or bytes of the internal memory address to be read. As a result, the read/write bit is a 0. After receiving the address and the read/write bit, the TAS5414B-Q1 or TAS5424B-Q1 responds with an acknowledge bit. In addition, after sending the internal memory address byte or bytes, the master device transmits another start condition followed by the TAS5414B-Q1 or TAS5424B-Q1 address and the read/write bit again. This time the read/write bit is a 1, indicating a read transfer. After receiving the address and the read/write bit, the TAS5414B-Q1 or TAS5424B-Q1 again responds with an acknowledge bit. Next, the TAS5414B-Q1 or TAS5424B-Q1 transmits the data byte from the memory address being read. After receiving the data byte, the master device transmits a not-acknowledge followed by a stop condition to complete the single-byte data-read transfer.

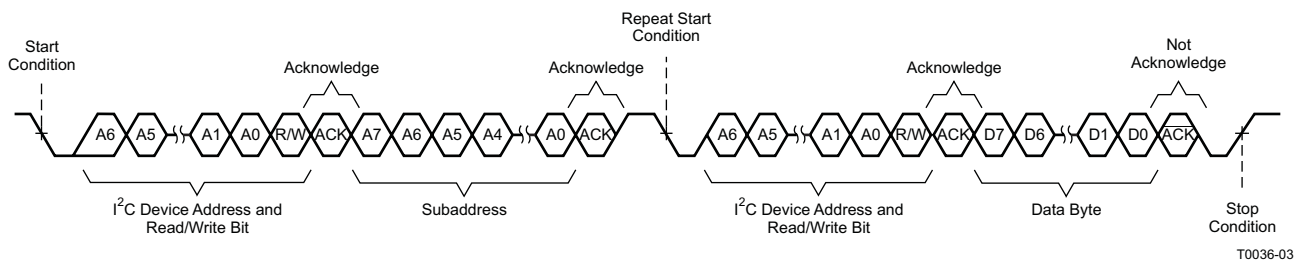

Figure 16. Random Read Transfer

Sequential Read

A sequential data-read transfer is identical to a single-byte data-read transfer except that multiple data bytes are transmitted by the TAS5414B-Q1 or TAS5424B-Q1 to the master device as shown in Figure 17. Except for the last data byte, the master device responds with an acknowledge bit after receiving each data byte and automatically increments the I²C subaddress by one. After receiving the last data byte, the master device transmits a not-acknowledge followed by a stop condition to complete the transfer.

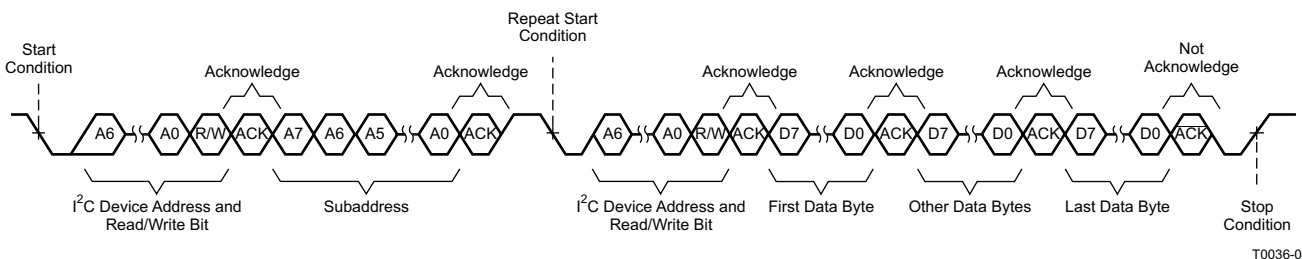

Figure 17. Sequential Read Transfer

Hardware Control Pins

There are four discrete hardware pins for real-time control and indication of device status.

FAULT pin: This active-low open-drain output pin indicates the presence of a fault condition that requires the device to go into the Hi-Z mode or standby mode. When this pin is asserted, the device has protected itself and the system from potential damage. The exact nature of the fault can be read via I²C with the exception of PVDD under-voltage faults below POR in which case the I²C bus is no longer operational. However, the fault is still indicated due to the fact that the **FAULT** pin is asserted.

CLIP_OTW pin: This active-low open-drain pin is configured via I²C to indicate one of the following conditions: overtemperature warning, the detection of clipping, or the logical OR of both of these conditions. During tweeter detect diagnostics, this pin also is asserted when a tweeter is present.

MUTE pin: This active-low pin is used for hardware control of the mute/unmute function for all four channels. Capacitor C_{MUTE} is used to control the time constant for the gain ramp needed to produce a pop- and click-free mute function. For pop- and click-free operation, the mute function should be implemented through I²C commands. The use of a hard mute with an external transistor does not ensure pop- and click-free operation, and is not recommended unless an *emergency hard mute* function is required in case of a loss of I²C control. The C_{MUTE} capacitor may not be shared between multiple devices.

STANDBY pin: When this active-low pin is asserted, the device goes into a complete shutdown, and current draw is limited to 2 μ A, typical. It can be used to shut down the device rapidly. If all channels are in Hi-Z the device will enter standby in ~1mS and if not a quick ramp down will occur that takes ~20mS. The outputs are ramped down quickly if not already in Hi-Z so externally biasing the **MUTE** pin will prevent the device from entering standby. All I²C register content is lost when this pin is asserted. The I²C bus goes into the high-impedance state when the **STANDBY** pin is asserted.

EMI Considerations

Automotive level EMI performance depends on both careful integrated circuit design and good system level design. Controlling sources of electromagnetic interference (EMI) was a major consideration in all aspects of the design.

The design has minimal parasitic inductances due to the short leads on the package. This dramatically reduces the EMI that results from current passing from the die to the system PCB. Each channel also operates at a different phase. The phase between channels is I²C selectable to either 45° or 180°, to reduce EMI caused by high-current switching. The design also incorporates circuitry that optimizes output transitions that cause EMI.

AM Radio Avoidance

To reduce interference in the AM radio band, the device has the ability to change the switching frequency via I²C commands. The recommended frequencies are listed in Table 21. The fundamental frequency and its second harmonic straddle the AM radio band listed. This eliminates the tones that can be present due to the switching frequency being demodulated by the AM radio.

Table 21. Recommended Switching Frequencies for AM Mode Operation

US		EUROPEAN	
AM FREQUENCY (kHz)	SWITCHING FREQUENCY (kHz)	AM FREQUENCY (kHz)	SWITCHING FREQUENCY (kHz)
540 - 670	417	522 - 675	417
680 - 980	500	676 - 945	500
990 - 1180	417	946 - 1188	417
1190 - 1420	500	1189 - 1422	500
1430 - 1580	417	1423 - 1584	417
1590 - 1700	500	1585 - 1701	500

Operating Modes and Faults

The operating modes and faults are depicted in the following tables.

Table 22. Operating Modes

STATE NAME	OUTPUT FETS	CHARGE PUMP	OSCILLATOR	I ² C	AVDD and DVDD
STANDBY	Hi-Z, floating	Stopped	Stopped	Stopped	OFF
Hi-Z	Hi-Z, weak pulldown	Active	Active	Active	ON
Mute	Switching at 50%	Active	Active	Active	ON

Table 22. Operating Modes (continued)

STATE NAME	OUTPUT FETS	CHARGE PUMP	OSCILLATOR	I ² C	AVDD and DVDD
Normal operation	Switching with audio	Active	Active	Active	ON

Table 23. Global Faults and Actions

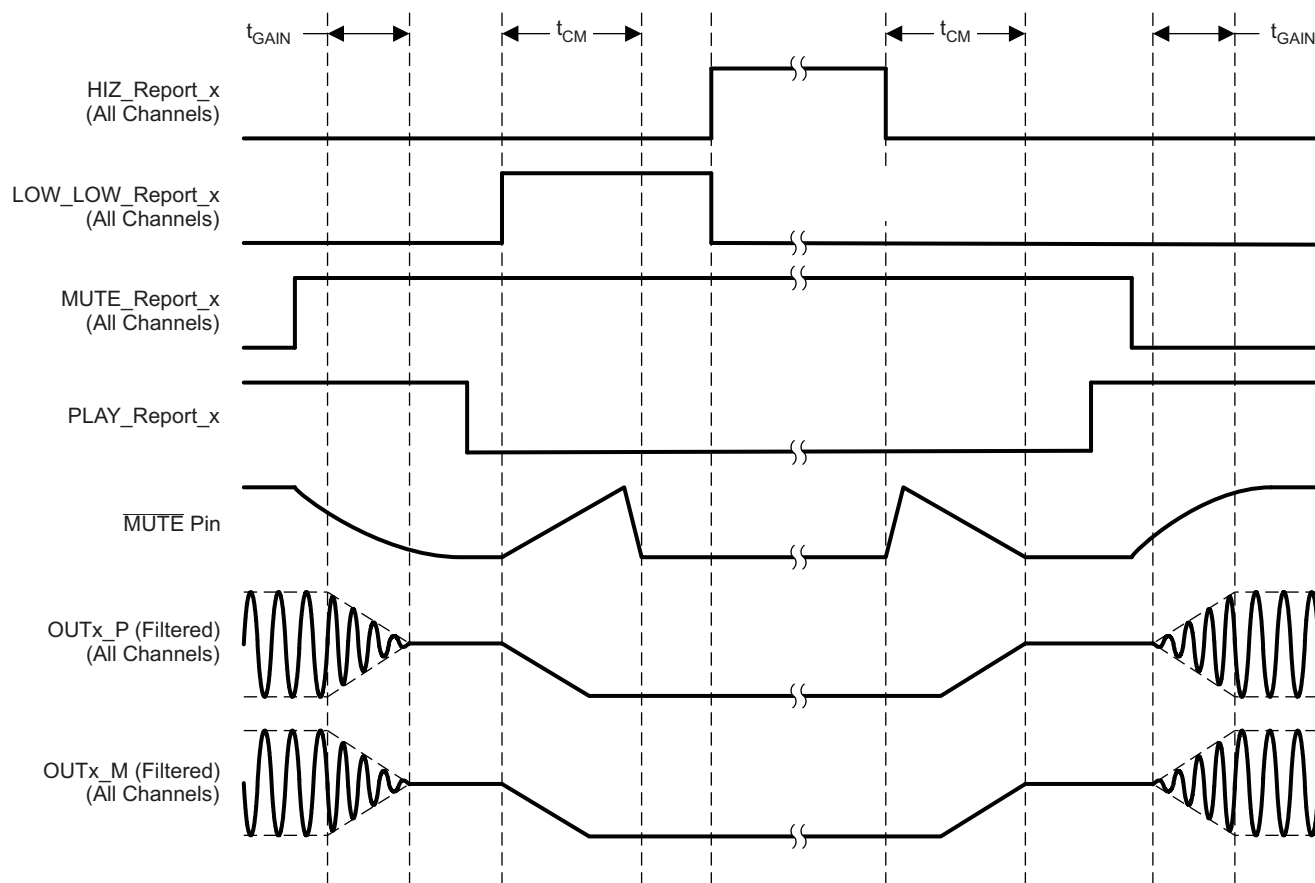

FAULT/ EVENT	FAULT/EVENT CATEGORY	MONITORING MODES	REPORTING METHOD	ACTION TYPE	ACTION RESULT	LATCHED/ SELF- CLEARING
POR	Voltage fault	All	$\overline{\text{FAULT}}$ pin	Hard mute (no ramp)	Standby	Self-clearing
UV		Hi-Z, mute, normal	$\text{I}^2\text{C} + \overline{\text{FAULT}}$ pin		Hi-Z	Latched
CP UV						
OV						
Load dump		All	$\overline{\text{FAULT}}$ pin		Standby	Self-clearing
OTW	Thermal warning	Hi-Z, mute, normal	$\text{I}^2\text{C} + \overline{\text{CLIP_OTW}}$ pin	None	None	Self-clearing
OTSD	Thermal fault	Hi-Z, mute, normal	$\text{I}^2\text{C} + \overline{\text{FAULT}}$ pin	Hard mute (no ramp)	Standby	Latched

Table 24. Channel Faults and Actions

FAULT/ EVENT	FAULT/EVENT CATEGORY	MONITORING MODES	REPORTING METHOD	ACTION TYPE	ACTION RESULT	LATCHED/ SELF- CLEARING
Open/short diagnostic	Diagnostic	Hi-Z (I ² C activated)	I ² C	None	None	Latched
Clipping	Warning	Mute / Play	$\overline{\text{CLIP_OTW}}$ pin	None	None	Self-clearing
CBC load current limit	Online protection			Current Limit	Start OC timer	Self-clearing
OC fault	Output channel fault		I ² C + $\overline{\text{FAULT}}$ pin	Hard mute	Hi-Z	Latched
DC detect				Hard mute	Hi-Z	Latched
OT Foldback	Warning		I ² C + $\overline{\text{CLIP_OTW}}$ pin	Reduce Gain	None	Self-clearing

Audio Shutdown and Restart Sequence

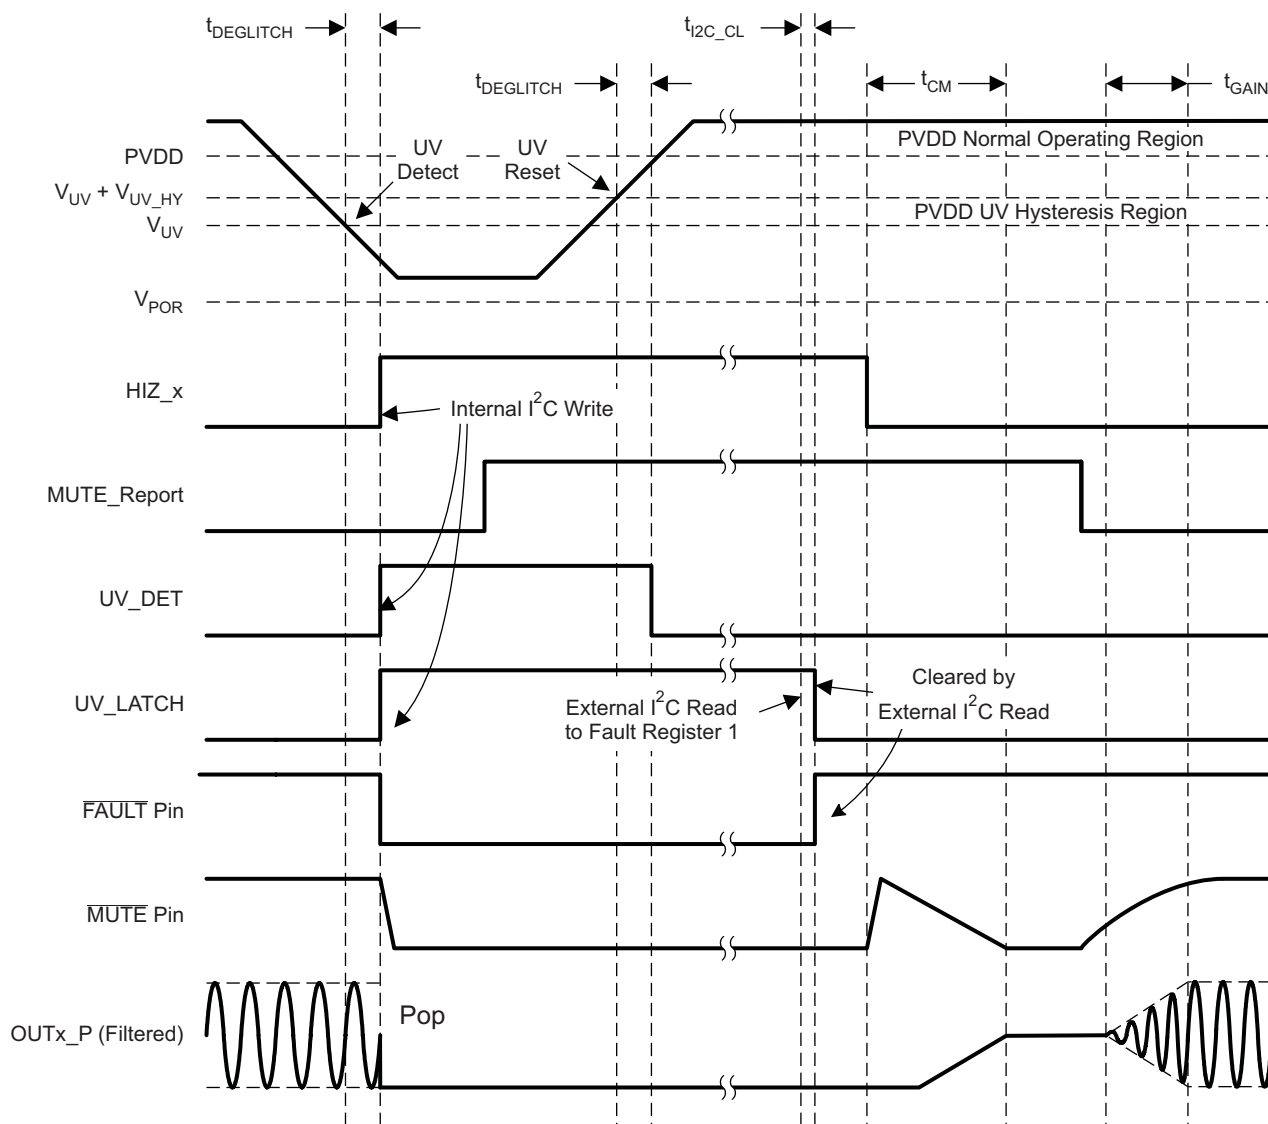

The gain ramp of the filtered output signal and the updating of the I²C registers correspond to the MUTE pin voltage during the ramping process. The length of time that the MUTE pin takes to complete its ramp is dictated by the value of the external capacitor on the MUTE pin. With the default 220nF capacitor the turn-on common mode ramp takes ~26mS and the gain ramp takes ~76mS.

APPLICATION INFORMATION

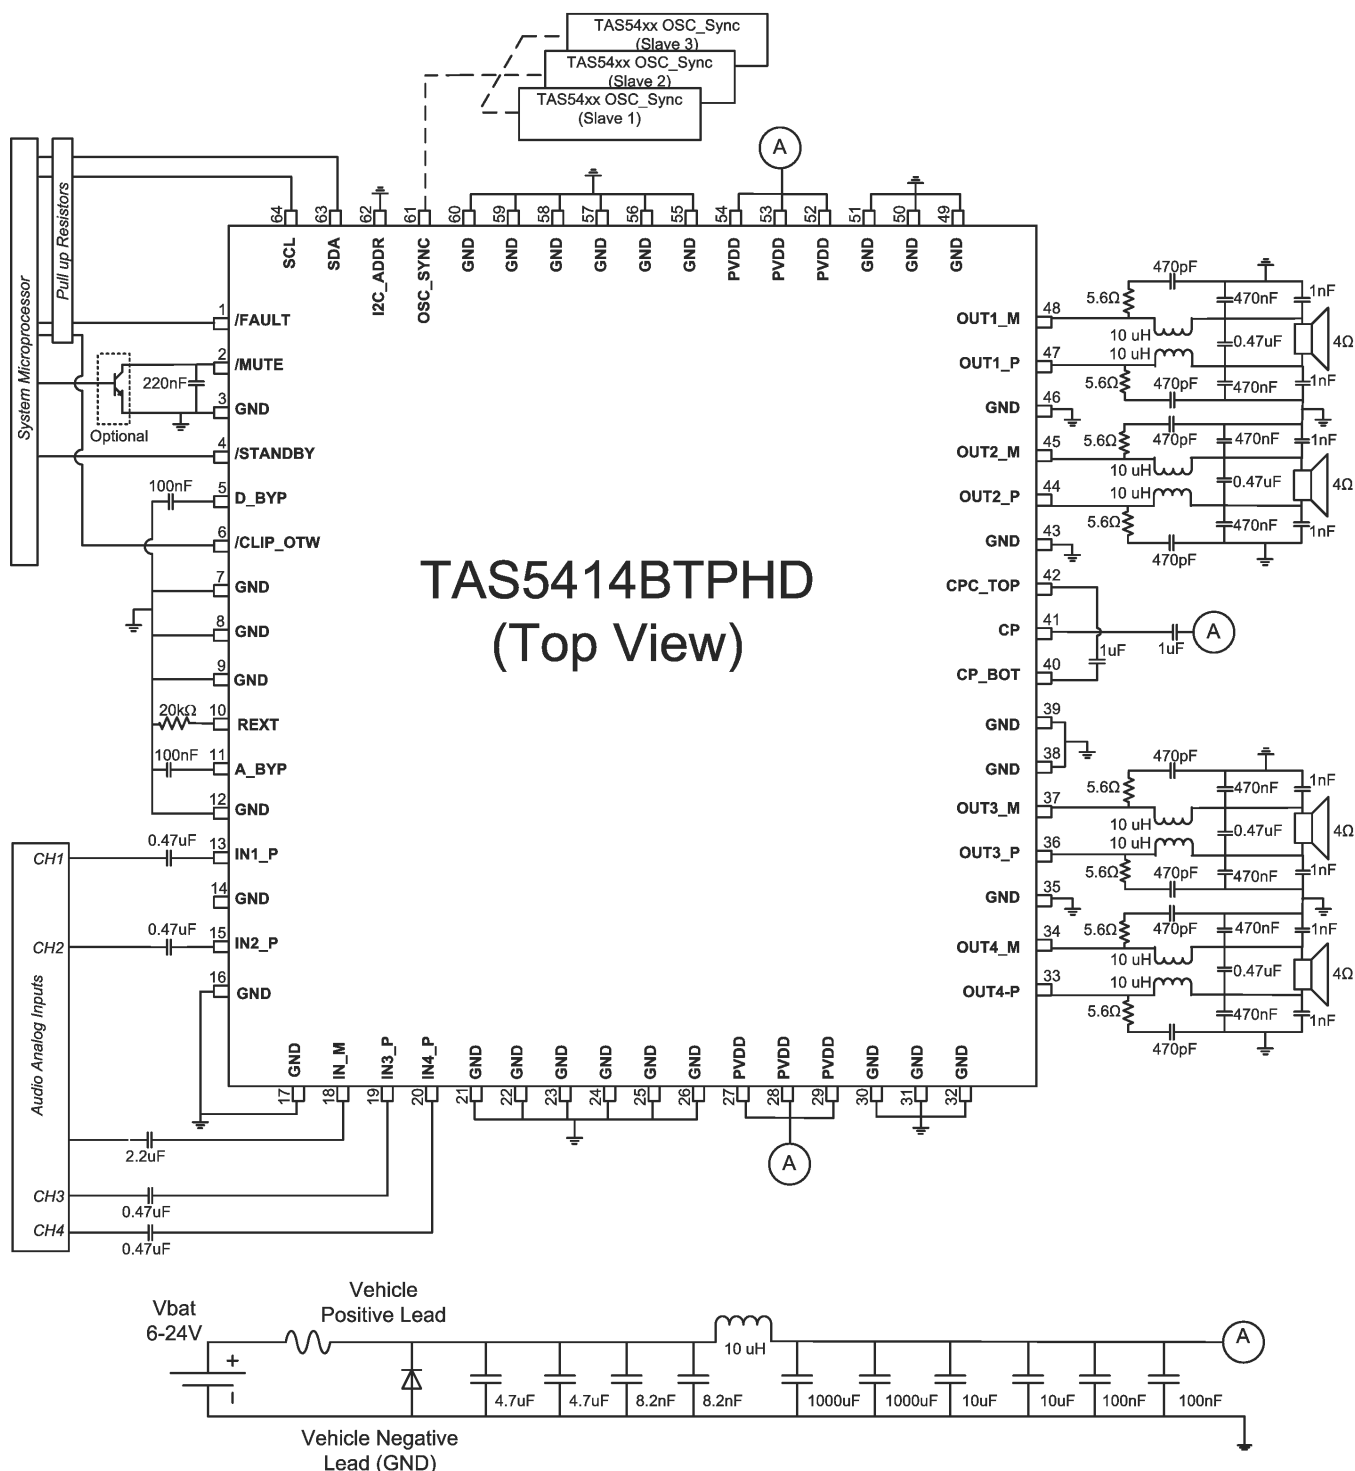

Figure 21. TAS5414B-Q1 Typical Application Schematic

Parallel Operation (PBTL)

The device can drive more current paralleling BTL channels on the load side of the LC output filter. For parallel operation, identical I²C settings are required for any two paralleled channels in order to have reliable system

performance and even power dissipation on multiple channels. For smooth power up, power down, and mute operation, the same control commands (such as mute, play, Hi-Z, etc.) should be sent to the paralleled channels at the same time. Load diagnostic is also supported for parallel connection. Paralleling on the device side of the LC output filter is not supported, and can result in device failure. When paralleling channels it is important to monitor channels for thermal foldback and lower the system gain for paralleled channels.

Input Filter Design

For the TAS5424B-Q1 device, the input filter for a single channel's P and M inputs should be identical. For the TAS5414B-Q1 the IN_M pin should have an impedance to GND that is equivalent to the parallel combination of the input impedances of all IN_P channels combined, including any source impedance from the previous stage in the system design. For example, if each of the 4 IN_P channels have a 1 μ F DC blocking capacitor, 1k Ω of series resistance due to an input RC filter, and 1k Ω of source resistance from the DAC supplying the audio signal, then the IN_M channel should have a 4 μ F capacitor in series with a 500 Ω resistor to GND (4 x 1 μ F in parallel = 4 μ F; 4 x 2k Ω in parallel = 500 Ω).

Demodulation Filter Design

The amplifier outputs are driven by high-current LDMOS transistors in an H-bridge configuration. These transistors are either fully off or on. The result is a square-wave output signal with a duty cycle that is proportional to the amplitude of the audio signal. It is recommended that a second-order LC filter be used to recover the audio signal. The main purpose of the demodulation filter is to attenuate the high-frequency components of the output signals that are out of the audio band. Design of the demodulation filter significantly affects the audio performance of the power amplifier. Therefore, to meet the system THD+N needs, the selection of the inductors used in the output filter should be carefully considered. The rule is that the inductance should stay above 10% of the inductance value within the range of peak current seen at maximum output power in the system design.

Line Driver Applications

In many automotive audio applications the end user would like to use the same head unit to drive either a speaker (with several Ohms of impedance) or an external amplifier (with several kOhms of impedance). The design is capable of supporting both applications; however, the output filter and system must be designed to handle the expected output load conditions.

Thermal Information

The thermally augmented package is designed to interface directly to heat sinks using a thermal interface compound (for example, Artic Silver, Ceramique thermal compound.) The heat sink then absorbs heat from the ICs and couples it to the local air. If louvers or fans are supplied, this process can reach equilibrium and heat can be continually removed from the ICs. Because of the device efficiency heat sinks can be smaller than those required for linear amplifiers of equivalent performance.

$R_{\theta JA}$ is a system thermal resistance from junction to ambient air. As such, it is a system parameter with the following components:

- $R_{\theta JC}$ (the thermal resistance from junction to case, or in this case the heat slug)
- Thermal grease thermal resistance
- Heat sink thermal resistance

The thermal grease thermal resistance can be calculated from the exposed heat slug area and the thermal grease manufacturer's area thermal resistance (expressed in $^{\circ}\text{C-in}^2/\text{W}$ or $^{\circ}\text{C-mm}^2/\text{W}$). The area thermal resistance of the example thermal grease with a 0.001-inch (0.0254-mm) thick layer is about 0.007 $^{\circ}\text{C-in}^2/\text{W}$ (4.52 $^{\circ}\text{C-mm}^2/\text{W}$). The approximate exposed heat slug size is as follows:

36/44-pin PSOP3	0.124 in ² (80 mm ²)
64-pin QFP	0.099 in ² (64 mm ²)

Dividing the example thermal grease area resistance by the area of the heat slug gives the actual resistance through the thermal grease for both parts:

36/44-pin PSOP3	0.06°C/W
64-pin QFP	0.07°C/W

The thermal resistance of thermal pads is generally considerably higher than a thin thermal grease layer. Thermal tape has an even higher thermal resistance and should not be used at all. Heat sink thermal resistance generally is predicted by the heat sink vendor, modeled using a continuous flow dynamics (CFD) model, or measured.

Thus, for a single monaural channel in the IC, the system $R_{\theta JA} = R_{\theta JC} + \text{thermal grease resistance} + \text{heat sink resistance}$.

The following table indicates modeled parameters for one device on a heat sink. The junction temperature is set at 115°C while delivering 20 W_{rms} per channel into 4-Ω loads with no clipping. It is assumed that the thermal grease is about 0.001 inches (0.0254 mm) thick.

Device	36-Pin PSOP3
Ambient temperature	25°C
Power to load	20 W × 4
Power dissipation	1.90 W × 4
ΔT inside package	7.6°C
ΔT through thermal grease	0.46°C
Required heatsink thermal resistance	10.78°C/W
Junction temperature	115°C
System $R_{\theta JA}$	11.85°C/W
$R_{\theta JA} \times \text{power dissipation}$	90°C

Electrical Connection of Heat Slug and Heat Sink

The heat sink connected to the heat slug of the device should be connected to GND or left floating. The heat slug should not be connected to any other electrical node.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

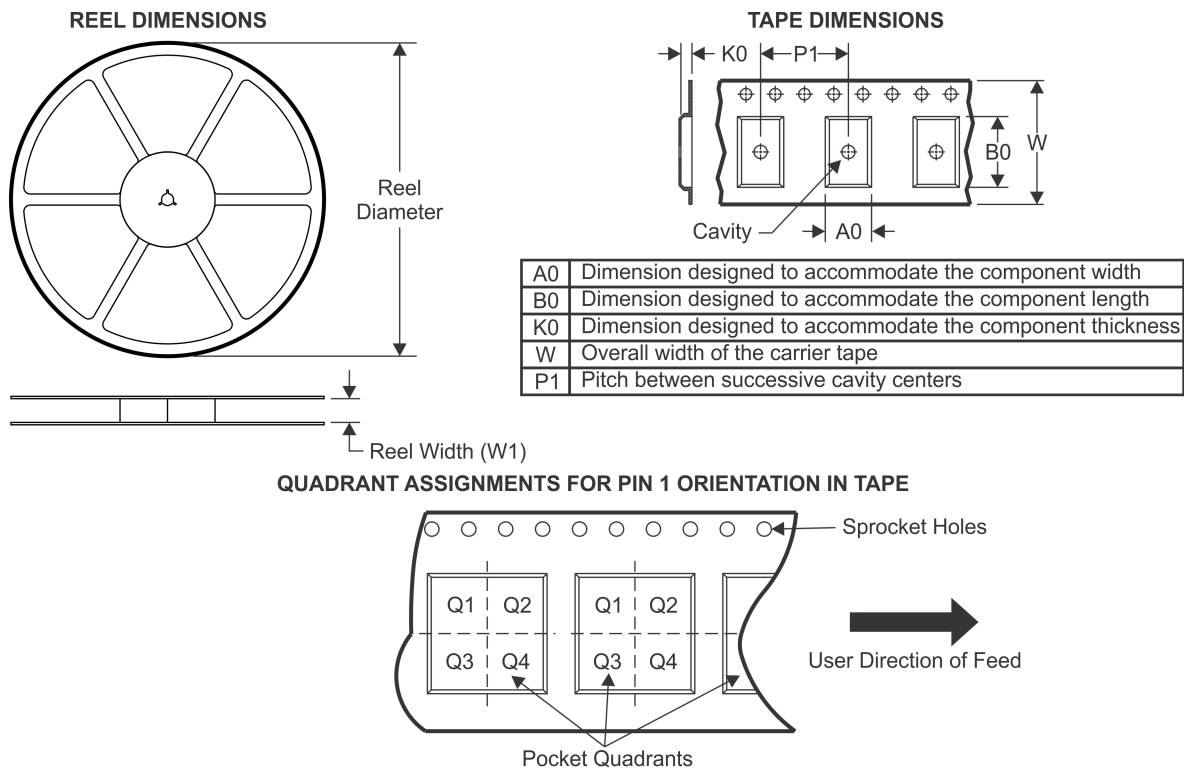

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

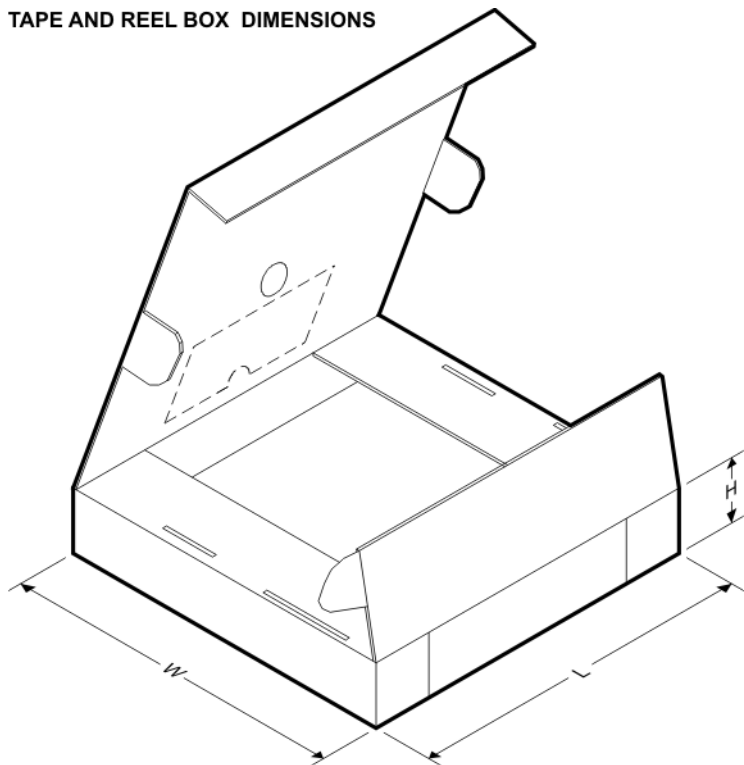

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

 - This drawing is subject to change without notice.
 - Body dimensions do not include mold flash or protrusion not to exceed 0.15mm.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
- △ The package thermal performance is optimized for conductive cooling with attachment to an external heat sink.

MECHANICAL DATA

PHD (S-PQFP-G64) PowerPAD™ PLASTIC QUAD FLATPACK (DIE DOWN)

NOTES:

- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion
D This package is designed to be attached directly to an external heatsink. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
See the product data sheet for details regarding the exposed thermal pad dimensions.
E. Falls within JEDEC MS-026

THERMAL PAD MECHANICAL DATA

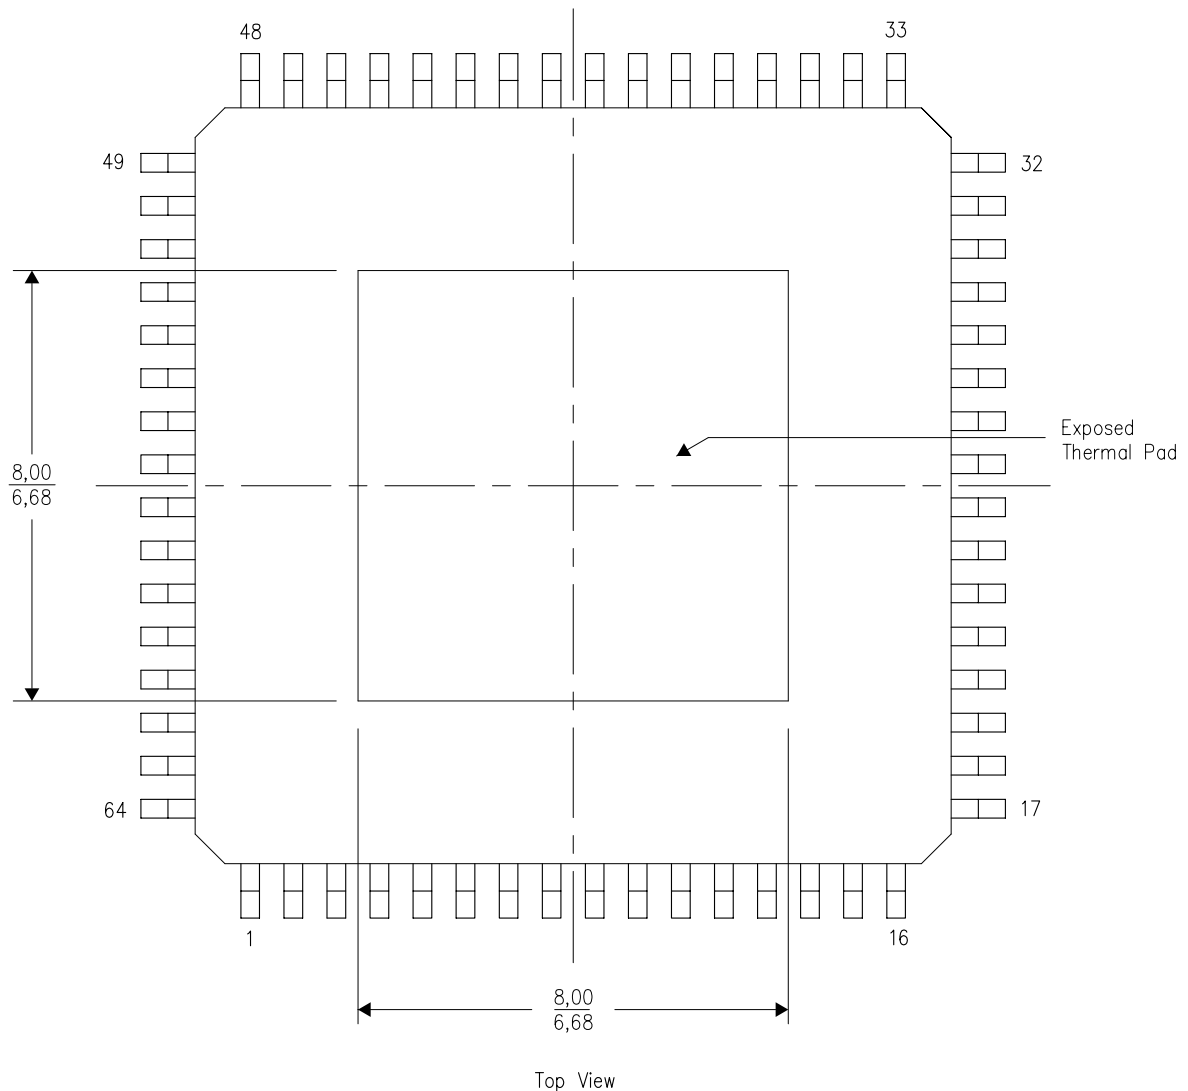

PHD (S-PQFP-G64) PowerPAD™ PLASTIC QUAD FLATPACK (DIE DOWN)

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

4206328-3/H 04/11

NOTE: A. All linear dimensions are in millimeters

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
