

## **$\pm 1^{\circ}\text{C}$ Remote and Local TEMPERATURE SENSOR with N-Factor and Series Resistance Correction**

## FEATURES

- **±1°C REMOTE DIODE SENSOR**
- **±1°C LOCAL TEMPERATURE SENSOR**
- **PROGRAMMABLE NON-IDEALITY FACTOR**
- **SERIES RESISTANCE CANCELLATION**
- **ALERT FUNCTION**
- **PROGRAMMABLE RESOLUTION: 9 to 12 Bits**
- **PROGRAMMABLE THRESHOLD LIMITS**
- **TWO-WIRE/SMBus™ SERIAL INTERFACE**
- **MINIMUM AND MAXIMUM TEMPERATURE MONITORS**
- **MULTIPLE INTERFACE ADDRESSES**
- **ALERT/THERM2 PIN CONFIGURATION**
- **DIODE FAULT DETECTION**

## APPLICATIONS

- LCD/DLP™/LCOS PROJECTORS
- SERVERS
- INDUSTRIAL CONTROLLERS
- CENTRAL OFFICE TELECOM EQUIPMENT
- DESKTOP AND NOTEBOOK COMPUTERS
- STORAGE AREA NETWORKS (SAN)
- INDUSTRIAL AND MEDICAL EQUIPMENT
- PROCESSOR/FPGA
- TEMPERATURE MONITORING

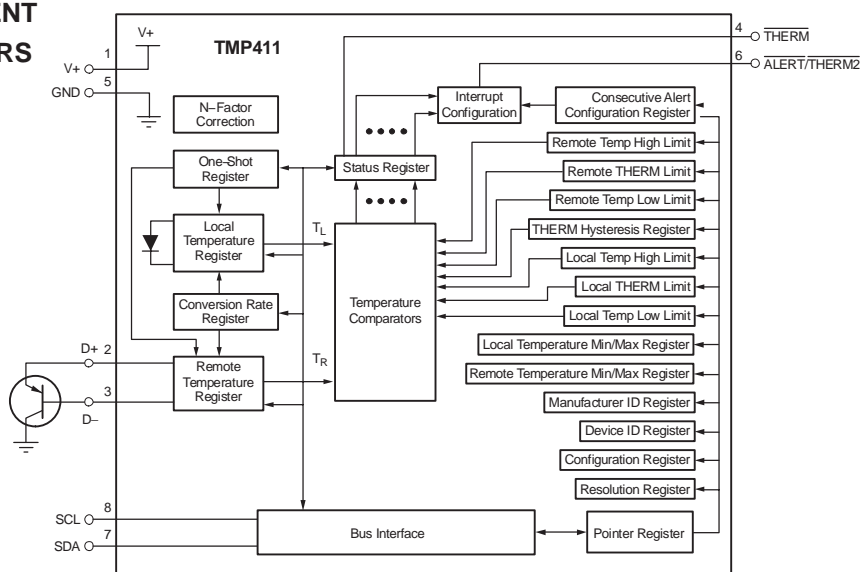

## DESCRIPTION

The TMP411 is a remote temperature sensor monitor with a built-in local temperature sensor. The remote temperature sensor diode-connected transistors are typically low-cost, NPN- or PNP-type transistors or diodes that are an integral part of microcontrollers, microprocessors, or FPGAs.

Remote accuracy is  $\pm 1^{\circ}\text{C}$  for multiple IC manufacturers, with no calibration needed. The Two-Wire serial interface accepts SMBus write byte, read byte, send byte, and receive byte commands to program the alarm thresholds and to read temperature data.

Features that are included in the TMP411 are: series resistance cancellation, programmable non-ideality factor, programmable resolution, programmable threshold limits, minimum and maximum temperature monitors, wide remote temperature measurement range (up to +150°C), diode fault detection, and temperature alert function.

The TMP411 is available in both MSOP-8 and SO-8 packages.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

DLP is a registered trademark of Texas Instruments. SMBus is a trademark of Intel Corp.

All other trademarks are the property of their respective owners.

**PRODUCTION DATA** information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

Power Supply, $V_S$	7.0V
Input Voltage, pins 2, 3, 4 only	–0.5V to $V_S + 0.5V$
Input Voltage, pins 6, 7, 8 only	–0.5V to 7V
Input Current	10mA
Operating Temperature Range	–55°C to +127°C
Storage Temperature Range	–60°C to +130°C
Junction Temperature ( $T_J$ max)	+150°C
ESD Rating:	
Human Body Model (HBM)	3000V
Charged Device Model (CDM)	1000V
Machine Model (MM)	200V

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not supported.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

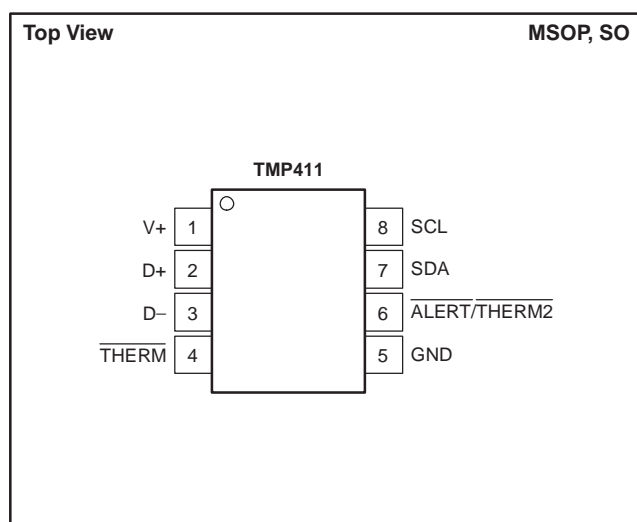

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## ORDERING INFORMATION<sup>(1)</sup>

PRODUCT	DESCRIPTION	I <sup>2</sup> C ADDRESS	PACKAGE-LEAD	PACKAGE DESIGNATOR	PACKAGE MARKING
TMP411A	Remote Junction Temperature Sensor	100 1100	MSOP-8	DGK	411A
			SO-8	D	T411A
TMP411B	Remote Junction Temperature Sensor	100 1101	MSOP-8	DGK	411B
			SO-8	D	T411B
TMP411C	Remote Junction Temperature Sensor	100 1110	MSOP-8	DGK	411C
			SO-8	D	T411C

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the TI web site at [www.ti.com](http://www.ti.com).

## PIN CONFIGURATION

## PIN ASSIGNMENTS

PIN	NAME	DESCRIPTION
1	V+	Positive supply (2.7V to 5.5V)
2	D+	Positive connection to remote temperature sensor
3	D–	Negative connection to remote temperature sensor
4	$\overline{\text{THERM}}$	Thermal flag, active low, open-drain; requires pull-up resistor to V+
5	GND	Ground
6	$\overline{\text{ALERT/THERM2}}$	Alert (reconfigurable as second thermal flag), active low, open-drain; requires pull-up resistor to V+
7	SDA	Serial data line for SMBus, open-drain; requires pull-up resistor to V+
8	SCL	Serial clock line for SMBus, open-drain; requires pull-up resistor to V+

## ELECTRICAL CHARACTERISTICS

At  $T_A = -40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  and  $V_S = 2.7\text{V}$  to  $5.5\text{V}$ , unless otherwise noted.

## APPLICATIONS INFORMATION

The TMP411 is a dual-channel digital temperature sensor that combines a local die temperature measurement channel and a remote junction temperature measurement channel in a single MSOP-8 or SO-8 package. The TMP411 is Two-Wire- and SMBus interface-compatible and is specified over a temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ . The TMP411 contains multiple registers for holding configuration information, temperature measurement results, temperature comparator maximum/minimum limits, and status information.

User-programmed high and low temperature limits stored in the TMP411 can be used to trigger an over/under temperature alarm ( $\overline{\text{ALERT}}$ ) on local and remote

temperatures. Additional thermal limits can be programmed into the TMP411 and used to trigger another flag ( $\overline{\text{THERM}}$ ) that can be used to initiate a system response to rising temperatures.

The TMP411 requires only a transistor connected between D+ and D- for proper remote temperature sensing operation. The SCL and SDA interface pins require pull-up resistors as part of the communication bus, while  $\overline{\text{ALERT}}$  and  $\overline{\text{THERM}}$  are open-drain outputs that also need pull-up resistors.  $\overline{\text{ALERT}}$  and  $\overline{\text{THERM}}$  may be shared with other devices if desired for a wired-OR implementation. A  $0.1\mu\text{F}$  power-supply bypass capacitor is recommended for good local bypassing. Figure 11 shows a typical configuration for the TMP411.

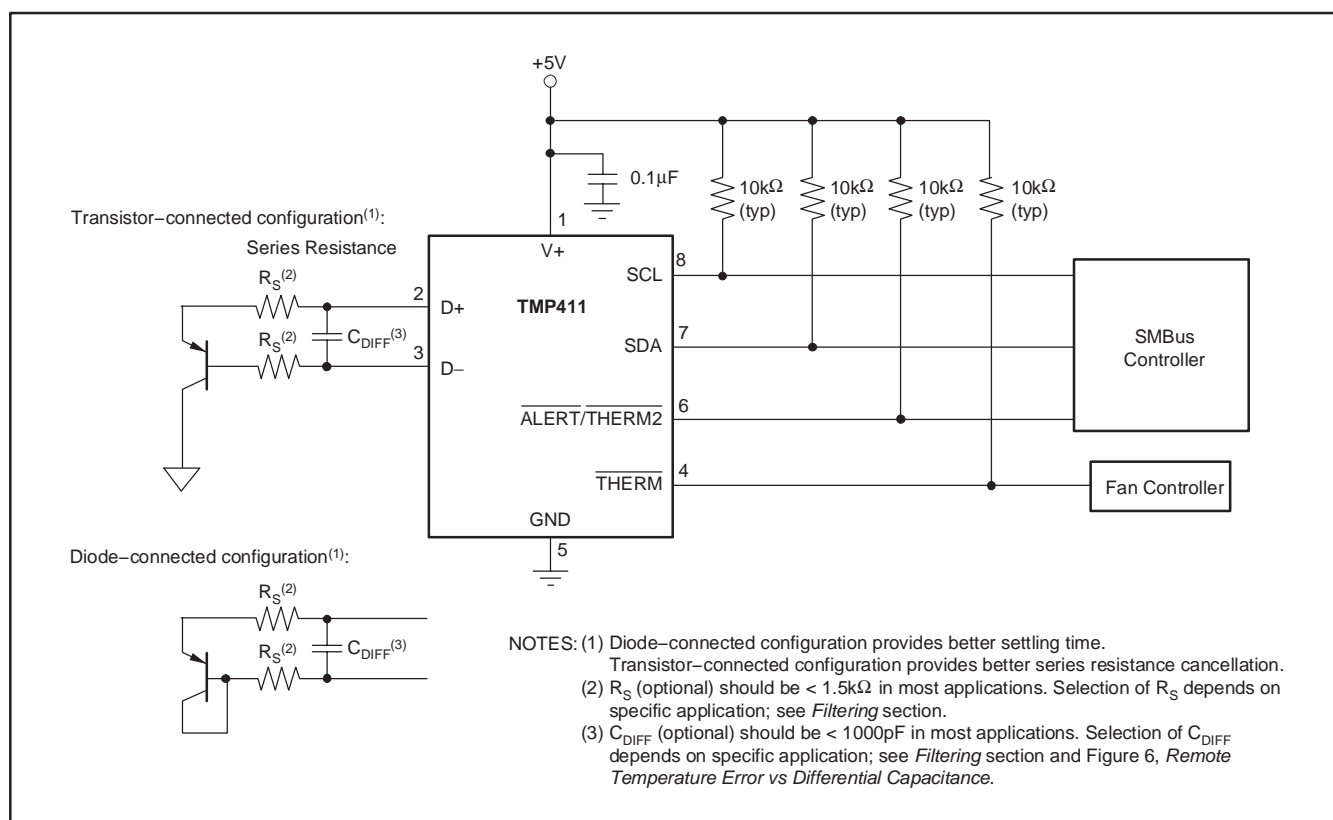

Figure 11. Basic Connections

## SERIES RESISTANCE CANCELLATION

Series resistance in an application circuit that typically results from printed circuit board (PCB) trace resistance and remote line length (see Figure 11) is automatically cancelled by the TMP411, preventing what would otherwise result in a temperature offset.

A total of up to 3kΩ of series line resistance is cancelled by the TMP411, eliminating the need for additional characterization and temperature offset correction.

See the two *Remote Temperature Error vs Series Resistance* typical characteristics curves for details on the effect of series resistance and power-supply voltage on sensed remote temperature error.

## DIFFERENTIAL INPUT CAPACITANCE

The TMP411 tolerates differential input capacitance of up to 1000pF with minimal change in temperature error. The effect of capacitance on sensed remote temperature error is illustrated in typical characteristic *Remote Temperature Error vs Differential Capacitance*. (Figure 6).

## TEMPERATURE MEASUREMENT DATA

Temperature measurement data are taken over a default range of 0°C to +127°C for both local and remote locations. Measurements from –55°C to +150°C can be made both locally and remotely by reconfiguring the TMP411 for the extended temperature range. To change the TMP411 configuration from the standard to the extended temperature range, switch bit 2 (RANGE) of the Configuration Register from low to high.

Temperature data resulting from conversions within the default measurement range are represented in binary form, as shown in Table 1, Standard Binary column. Note that any temperature below 0°C results in a data value of zero (00h). Likewise, temperatures above +127°C result in a value of 127 (7Fh). The device can be set to measure over an extended temperature range by changing bit 2 of the Configuration Register from low to high. The change in measurement range and data format from standard binary to extended binary occurs at the next temperature conversion. For data captured in the extended temperature range configuration, an offset of 64 (40h) is added to the standard binary value, as shown in Table 1, Extended Binary column. This configuration allows measurement of temperatures below 0°C. Note that binary values corresponding to temperatures as low as –64°C, and as high as +191°C are possible; however, most temperature sensing diodes only measure with the range of –55°C to +150°C. Additionally, the TMP411 is rated only

for ambient local temperatures ranging from –40°C to +125°C. Parameters in the Absolute Maximum Ratings table must be observed.

**Table 1. Temperature Data Format  
(Local and Remote Temperature High Bytes)**

TEMP (°C)	LOCAL/REMOTE TEMPERATURE REGISTER HIGH BYTE VALUE (+1°C RESOLUTION)

175	0111 1111	7F	1110 1111	EF
191	0111 1111	7F	1111 1111	FF

**NOTE:** Whenever changing between standard and extended temperature ranges, be aware that the temperatures stored in the temperature limit registers are NOT automatically reformatted to correspond to the new temperature range format. These temperature limit values must be reprogrammed in the appropriate binary or extended binary format.

Both local and remote temperature data use two bytes for data storage. The high byte stores the temperature with 1°C resolution. The second or low byte stores the decimal fraction value of the temperature and allows a higher measurement resolution; see Table 2. The measurement resolution for the remote channel is 0.0625°C, and is not adjustable. The measurement resolution for the local channel is adjustable; it can be set for 0.5°C, 0.25°C, 0.125°C, or 0.0625°C by setting the RES1 and RES0 bits of the Resolution Register; see the *Resolution Register* section.

**Table 2. Decimal Fraction Temperature Data Format (Local and Remote Temperature Low Bytes)**

## REGISTER INFORMATION

The TMP411 contains multiple registers for holding configuration information, temperature measurement results, temperature comparator maximum/minimum, limits, and status information. These registers are described in Figure 12 and Table 3.

### POINTER REGISTER

Figure 12 shows the internal register structure of the TMP411. The 8-bit Pointer Register is used to address a given data register. The Pointer Register identifies which of the data registers should respond to a read or write command on the Two-Wire bus. This register is set with every write command. A write command must be issued to set the proper value in the Pointer Register before executing a read command. Table 3 describes the pointer address of the registers available in the TMP411. The power-on reset (POR) value of the Pointer Register is 00h (0000 0000b).

**Figure 12. Internal Register Structure**

<sup>(1)</sup> NA = not applicable; register is write- or read-only.

<sup>(2)</sup> X = indeterminate state.

## TEMPERATURE REGISTERS

The TMP411 has four 8-bit registers that hold temperature measurement results. Both the local channel and the remote channel have a high byte register that contains the most significant bits (MSBs) of the temperature analog-to-digital converter (ADC) result and a low byte register that contains the least significant bits (LSBs) of the temperature ADC result. The local channel high byte address is 00h; the local channel low byte address is 15h. The remote channel high byte is at address 01h; the remote channel low byte address is 10h. These registers are read-only and are updated by the ADC each time a temperature measurement is completed.

The TMP411 contains circuitry to assure that a low byte register read command returns data from the same ADC conversion as the immediately preceding high byte read command. This assurance remains valid only until another register is read. For proper operation, the high byte of a temperature register should be read first. The low byte register should be read in the next read command. The low byte register may be left unread if the LSBs are not needed. Alternatively, the temperature registers may be read as a 16-bit register by using a single two-byte read command from address 00h for the local channel result or from address 01h for the remote channel result. The high byte will be output first, followed by the low byte. Both bytes of this read operation will be from the same ADC conversion. The power-on reset value of both temperature registers is 00h.

## LIMIT REGISTERS

The TMP411 has 11 registers for setting comparator limits for both the local and remote measurement channels. These registers have read and write capability. The High and Low Limit Registers for both channels span two registers, as do the temperature registers. The local temperature high limit is set by writing the high byte to pointer address 0Bh and writing the low byte to pointer address 16h, or by using a single two-byte write command (high byte first) to pointer address 0Bh. The local temperature high limit is obtained by reading the high byte from pointer address 05h and the low byte from pointer address 16h or by using a two-byte read command from pointer address 05h. The power-on reset value of the local temperature high limit is 55h/00h. The power-on reset value of the local temperature high limit is 55h/00h (+85°C in standard temperature mode; +21°C in extended temperature mode).

Similarly, the local temperature low limit is set by writing the high byte to pointer address 0Ch and writing the low byte to pointer address 17h, or by using a single two-byte write command to pointer address 0Ch. The local

temperature low limit is read by reading the high byte from pointer address 06h and the low byte from pointer address 17h, or by using a two-byte read from pointer address 06h. The power-on reset value of the local temperature low limit register is 00h/00h (0°C in standard temperature mode; –64°C in extended mode).

The remote temperature high limit is set by writing the high byte to pointer address 0Dh and writing the low byte to pointer address 13h, or by using a two-byte write command to pointer address 0Dh. The remote temperature high limit is obtained by reading the high byte from pointer address 07h and the low byte from pointer address 13h, or by using a two-byte read command from pointer address 07h. The power-on reset value of the Remote Temperature High Limit Register is 55h/00h (+85°C in standard temperature mode; +21°C in extended temperature mode).

The remote temperature low limit is set by writing the high byte to pointer address 0Eh and writing the low byte to pointer address 14h, or by using a two-byte write to pointer address 0Eh. The remote temperature low limit is read by reading the high byte from pointer address 08h and the low byte from pointer address 14h, or by using a two-byte read from pointer address 08h. The power-on reset value of the Remote Temperature Low Limit Register is 00h/00h (0°C in standard temperature mode; –64°C in extended mode).

The TMP411 also has a THERM limit register for both the local and the remote channels. These registers are eight bits and allow for THERM limits set to 1°C resolution. The local channel THERM limit is set by writing to pointer address 20h. The remote channel THERM limit is set by writing to pointer address 19h. The local channel THERM limit is obtained by reading from pointer address 20h; the remote channel THERM limit is read by reading from pointer address 19h. The power-on reset value of the THERM limit registers is 55h (+85°C in standard temperature mode; +21°C in extended temperature mode). The THERM limit comparators also have hysteresis. The hysteresis of both comparators is set by writing to pointer address 21h. The hysteresis value is obtained by reading from pointer address 21h. The value in the Hysteresis Register is an unsigned number (always positive). The power-on reset value of this register is 0Ah (+10°C).

Whenever changing between standard and extended temperature ranges, be aware that the temperatures stored in the temperature limit registers are NOT automatically reformatted to correspond to the new temperature range format. These values must be reprogrammed in the appropriate binary or extended binary format.

## STATUS REGISTER

The TMP411 has a Status Register to report the state of the temperature comparators. Table 4 shows the Status Register bits. The Status Register is read-only and is read by reading from pointer address 02h.

The BUSY bit reads as '1' if the ADC is making a conversion. It reads as '0' if the ADC is not converting.

The OPEN bit reads as '1' if the remote transistor was detected as open since the last read of the Status Register. The OPEN status is only detected when the ADC is attempting to convert a remote temperature.

The RTHRM bit reads as '1' if the remote temperature has exceeded the remote THERM limit and remains greater than the remote THERM limit less the value in the shared Hysteresis Register; see Figure 18.

The LTHRM bit reads as '1' if the local temperature has exceeded the local THERM limit and remains greater than the local THERM limit less the value in the shared Hysteresis Register; see Figure 18.

The LHIGH and RHIGH bit values depend on the state of the AL/TH bit in the Configuration Register. If the AL/TH bit is '0', the LHIGH bit reads as '1' if the local high limit was exceeded since the last clearing of the Status Register. The RHIGH bit reads as '1' if the remote high limit was exceeded since the last clearing of the Status Register. If the AL/TH bit is '1', the remote high limit and the local high limit are used to implement a THERM2 function. LHIGH reads as '1' if the local temperature has exceeded the local high limit and remains greater than the local high limit less the value in the Hysteresis Register.

The RHIGH bit reads as '1' if the remote temperature has exceeded the remote high limit and remains greater than the remote high limit less the value in the Hysteresis Register.

The LLOW and RLOW bits are not affected by the AL/TH bit. The LLOW bit reads as '1' if the local low limit was exceeded since the last clearing of the Status Register. The RLOW bit reads as '1' if the remote low limit was exceeded since the last clearing of the Status Register.

The values of the LLOW, RLOW, and OPEN (as well as LHIGH and RHIGH when AL/TH is '0') are latched and will read as '1' until the Status Register is read or a device reset occurs. These bits are cleared by reading the Status Register, provided that the condition causing the flag to be set no longer exists. The values of BUSY, LTHRM, and RTHRM (as well as LHIGH and RHIGH when  $\overline{\text{ALERT/THERM2}}$  is '1') are not latched and are not cleared by reading the Status Register. They always indicate the current state, and are updated appropriately at the end of the corresponding ADC conversion. Clearing the Status Register bits does not clear the state of the  $\overline{\text{ALERT}}$  pin; an SMBus alert response address command must be used to clear the  $\overline{\text{ALERT}}$  pin.

The TMP411 NORs LHIGH, LLOW, RHIGH, RLOW, and OPEN, so a status change for any of these flags from '0' to '1' automatically causes the  $\overline{\text{ALERT}}$  pin to go low (only applies when the  $\overline{\text{ALERT/THERM2}}$  pin is configured for ALERT mode).

**Table 4. Status Register Format**

STATUS REGISTER (Read = 02h, Write = NA)								
BIT #	D7	D6	D5	D4	D3	D2	D1	D0
BIT NAME	BUSY	LHIGH	LLOW	RHIGH	RLOW	OPEN	RTHRM	LTHRM
POR VALUE	0 <sup>(1)</sup>	0	0	0	0	0	0	0

(1) The BUSY bit will change to '1' almost immediately ( $\ll 100\mu\text{s}$ ) following power-up, as the TMP411 begins the first temperature conversion. It will be high whenever the TMP411 is converting a temperature reading.

## CONFIGURATION REGISTER

The Configuration Register sets the temperature range, controls shutdown mode, and determines how the  $\overline{\text{ALERT}}/\text{THERM2}$  pin functions. The Configuration Register is set by writing to pointer address 09h and read by reading from pointer address 03h.

The MASK bit (bit 7) enables or disables the  $\overline{\text{ALERT}}$  pin output if  $\text{AL}/\text{TH} = 0$ . If  $\text{AL}/\text{TH} = 1$  then the MASK bit has no effect. If MASK is set to '0', the  $\overline{\text{ALERT}}$  pin goes low when one of the temperature measurement channels exceeds its high or low limits for the chosen number of consecutive conversions. If the MASK bit is set to '1', the TMP411 retains the  $\overline{\text{ALERT}}$  pin status, but the  $\overline{\text{ALERT}}$  pin will not go low.

The shutdown (SD) bit (bit 6) enables or disables the temperature measurement circuitry. If  $\text{SD} = 0$ , the TMP411 converts continuously at the rate set in the conversion rate register. When SD is set to '1', the TMP411 immediately stops converting and enters a shutdown mode. When SD is set to '0' again, the TMP411 resumes continuous conversions. A single conversion can be started when  $\text{SD} = 1$  by writing to the One-Shot Register.

The AL/TH bit (bit 5) controls whether the  $\overline{\text{ALERT}}$  pin functions in ALERT mode or THERM2 mode. If  $\text{AL}/\text{TH} = 0$ , the  $\overline{\text{ALERT}}$  pin operates as an interrupt pin. In this mode,

the  $\overline{\text{ALERT}}$  pin goes low after the set number of consecutive out-of-limit temperature measurements occur.

If  $\text{AL}/\text{TH} = 1$ , the  $\overline{\text{ALERT}}/\text{THERM2}$  pin implements a THERM function ( $\overline{\text{THERM2}}$ ). In this mode,  $\overline{\text{THERM2}}$  functions similar to the  $\overline{\text{THERM}}$  pin except that the local high limit and remote high limit registers are used for the thresholds.  $\overline{\text{THERM2}}$  goes low when either RHIGH or LHIGH is set.

The temperature range is set by configuring bit 2 of the Configuration Register. Setting this bit low configures the TMP411 for the standard measurement range ( $0^{\circ}\text{C}$  to  $+127^{\circ}\text{C}$ ); temperature conversions will be stored in the standard binary format. Setting bit 2 high configures the TMP411 for the extended measurement range ( $-55^{\circ}\text{C}$  to  $+150^{\circ}\text{C}$ ); temperature conversions will be stored in the extended binary format (see Table 1).

The remaining bits of the Configuration Register are reserved and must always be set to '0'. The power-on reset value for this register is 00h. Table 5 summarizes the bits of the Configuration Register.

**Table 5. Configuration Register Bit Descriptions**

CONFIGURATION REGISTER (Read = 03h, Write = 09h, POR = 00h)			
BIT	NAME	FUNCTION	POWER-ON RESET VALUE
7	MASK	0 = ALERT Enabled 1 = ALERT Masked	0
6	SD	0 = Run 1 = Shut Down	0
5	AL/TH	0 = ALERT Mode 1 = THERM Mode	0
4, 3	Reserved	—	0
2	Temperature Range	0 = $0^{\circ}\text{C}$ to $+127^{\circ}\text{C}$ 1 = $-55^{\circ}\text{C}$ to $+150^{\circ}\text{C}$	0
1, 0	Reserved	—	0

## RESOLUTION REGISTER

The RES1 and RES0 bits (resolution bits 1 and 0) of the Resolution Register set the resolution of the local temperature measurement channel. Remote temperature measurement channel resolution is not affected. Changing the local channel resolution also affects the conversion time and rate of the TMP411. The Resolution Register is set by writing to pointer address 1Ah and is read by reading from pointer address 1Ah. Table 6 shows the resolution bits for the Resolution Register.

**Table 6. Resolution Register:  
Local Channel Programmable Resolution**

RESOLUTION REGISTER (Read = 1Ah, Write = 1Ah, POR = 1Ch)			
RES1	RES0	RESOLUTION	CONVERSION TIME (Typical)
0	0	9 Bits (0.5°C)	12.5ms
0	1	10 Bits (0.25°C)	25ms
1	0	11 Bits (0.125°C)	50ms
1	1	12 Bits (0.0625°C)	100ms

Bits 2 through 4 of the Resolution Register must always be set to '1'. Bits 5 through 7 of the Resolution Register must always be set to '0'. The power-on reset value of this register is 1Ch.

## CONVERSION RATE REGISTER

The Conversion Rate Register controls the rate at which temperature conversions are performed. This register adjusts the idle time between conversions but not the

conversion timing itself, thereby allowing the TMP411 power dissipation to be balanced with the temperature register update rate. Table 7 shows the conversion rate options and corresponding current consumption.

## ONE-SHOT CONVERSION

When the TMP411 is in shutdown mode (SD = 1 in the Configuration Register), a single conversion on both channels is started by writing any value to the One-Shot Start Register, pointer address 0Fh. This write operation starts one conversion; the TMP411 returns to shutdown mode when that conversion completes. The value of the data sent in the write command is irrelevant and is not stored by the TMP411. When the TMP411 is in shutdown mode, an initial 200μs is required before a one-shot command can be given. (**Note:** When a shutdown command is issued, the TMP411 completes the current conversion before shutting down.) This wait time only applies to the 200μs immediately following shutdown. One-shot commands can be issued without delay thereafter.

**Table 7. Conversion Rate Register**

CONVERSION RATE REGISTER (Read = 04h, Write = 0Ah, POR = 08h)										
R7	R6	R5	R4	R3	R2	R1	R0	CONVERSION/SEC	AVERAGE I <sub>Q</sub> (TYP) (μA)

0	0	0	0	0	1	1	0	4	190	220
07h to 0Fh								8	373	413

## N-FACTOR CORRECTION REGISTER

The TMP411 allows for a different  $n$ -factor value to be used for converting remote channel measurements to temperature. The remote channel uses sequential current excitation to extract a differential  $V_{BE}$  voltage measurement to determine the temperature of the remote transistor. Equation 1 relates this voltage and temperature.

$$V_{BE2} - V_{BE1} = \frac{nkT}{q} \ln\left(\frac{I_2}{I_1}\right) \quad (1)$$

The value  $n$  in Equation 1 is a characteristic of the particular transistor used for the remote channel. The default value for the TMP411 is  $n = 1.008$ . The value in the N-Factor Correction Register may be used to adjust the effective  $n$ -factor according to Equation 2 and Equation 3.

$$n_{\text{eff}} = \frac{1.008 \cdot 300}{(300 - N_{\text{ADJUST}})} \quad (2)$$

$$N_{\text{ADJUST}} = 300 - \left( \frac{300 \cdot 1.008}{n_{\text{eff}}} \right) \quad (3)$$

The  $n$ -correction value must be stored in two's-complement format, yielding an effective data range from  $-128$  to  $+127$ , as shown in Table 8. The  $n$ -correction value may be written to and read from pointer address 18h. The register power-on reset value is 00h, thus having no effect unless written to.

**Table 8. N-Factor Range**

## MINIMUM AND MAXIMUM REGISTERS

The TMP411 stores the minimum and maximum temperature measured since power-on, chip-reset, or minimum and maximum register reset for both the local and remote channels. The Local Temperature Minimum Register may be read by reading the high byte from pointer address 30h and the low byte from pointer address 31h. The Local Temperature Minimum Register may also be read by using a two-byte read command from pointer address 30h. The Local Temperature Minimum Register is reset at power-on, by executing the chip-reset command, or by writing any value to any of pointer addresses 30h through 37h. The reset value for these registers is FFh/F0h.

The Local Temperature Maximum Register may be read by reading the high byte from pointer address 32h and the low byte from pointer address 33h. The Local Temperature Maximum Register may also be read by using a two-byte read command from pointer address 32h. The Local Temperature Maximum Register is reset at power-on by executing the chip reset command, or by writing any value to any of pointer addresses 30h through 37h. The reset value for these registers is 00h/00h.

The Remote Temperature Minimum Register may be read by reading the high byte from pointer address 34h and the low byte from pointer address 35h. The Remote Temperature Minimum Register may also be read by using a two-byte read command from pointer address 34h. The Remote Temperature Minimum Register is reset at power-on by executing the chip reset command, or by writing any value to any of pointer addresses 30h through 37h. The reset value for these registers is FFh/F0h.

The Remote Temperature Maximum Register may be read by reading the high byte from pointer address 36h and the low byte from pointer address 37h. The Remote Temperature Maximum Register may also be read by using a two-byte read command from pointer address 36h. The Remote Temperature Maximum Register is reset at power-on by executing the chip reset command, or by writing any value to any of pointer addresses 30h through 37h. The reset value for these registers is 00h/00h.

## SOFTWARE RESET

The TMP411 may be reset by writing any value to Pointer Register FCh. This restores the power-on reset state to all of the TMP411 registers as well as abort any conversion in process and clear the ALERT and THERM pins.

The TMP411 also supports reset via the two-wire general call address (00000000). The TMP411 acknowledges the general call address and responds to the second byte. If the second byte is 00000110, the TMP411 executes a software reset. The TMP411 takes no action in response to other values in the second byte.

## CONSECUTIVE ALERT REGISTER

The value in the Consecutive Alert Register (address 22h) determines how many consecutive out-of-limit measurements must occur on a measurement channel before the ALERT signal is activated. The value in this register does not affect bits in the Status Register. Values of one, two, three, or four consecutive conversions can be selected; one conversion is the default. This function allows additional filtering for the ALERT pin. The consecutive alert bits are shown in Table 9.

**Table 9. Consecutive Alert Register**

CONSECUTIVE ALERT REGISTER (READ = 22h, WRITE = 22h, POR = 01h)			
C2	C1	C0	NUMBER OF CONSECUTIVE OUT-OF-LIMIT MEASUREMENTS
0	0	0	1
0	0	1	2
0	1	1	3
1	1	1	4

**NOTE:** Bit 7 of the Consecutive Alert Register controls the enable/disable of the timeout function. See the *Timeout Function* section for a description of this feature.

## THERM HYSTERESIS REGISTER

The THERM Hysteresis Register, shown in Table 11, stores the hysteresis value used for the THERM pin alarm function. This register must be programmed with a value that is less than the Local Temperature High Limit Register value, Remote Temperature High Limit Register value, Local THERM Limit Register value, or Remote THERM Limit Register value; otherwise, the respective temperature comparator will not trip on the measured temperature falling edges. Allowable hysteresis values

are shown in Table 10. The default hysteresis value is 10°C, whether the device is operating in the standard or extended mode setting.

**Table 10. Allowable THERM Hysteresis Values**

TEMPERATURE (°C)	THERM HYSTERESIS VALUE	
	TH[11:4] (STANDARD BINARY)	(HEX)
0	0000 0000	00
1	0000 0001	01
5	0000 0101	05

225	1110 0001	E1
255	1111 1111	FF

## BUS OVERVIEW

The TMP411 is SMBus interface-compatible. In SMBus protocol, the device that initiates the transfer is called a master, and the devices controlled by the master are slaves. The bus must be controlled by a master device that generates the serial clock (SCL), controls the bus access, and generates the START and STOP conditions.

To address a specific device, a START condition is initiated. START is indicated by pulling the data line (SDA) from a high to low logic level while SCL is high. All slaves on the bus shift in the slave address byte, with the last bit indicating whether a read or write operation is intended. During the ninth clock pulse, the slave being addressed responds to the master by generating an Acknowledge and pulling SDA low.

Data transfer is then initiated and sent over eight clock pulses followed by an Acknowledge bit. During data transfer SDA must remain stable while SCL is high, because any change in SDA while SCL is high is interpreted as a control signal.

Once all data has been transferred, the master generates a STOP condition. STOP is indicated by pulling SDA from low to high, while SCL is high.

## SERIAL INTERFACE

The TMP411 operates only as a slave device on either the Two-Wire bus or the SMBus. Connections to either bus are made via the open-drain I/O lines, SDA and SCL. The SDA and SCL pins feature integrated spike suppression filters and Schmitt triggers to minimize the effects of input spikes and bus noise. The TMP411 supports the transmission protocol for fast (1kHz to 400kHz) and high-speed (1kHz to 3.4MHz) modes. All data bytes are transmitted MSB first.

## SERIAL BUS ADDRESS

To communicate with the TMP411, the master must first address slave devices via a slave address byte. The slave address byte consists of seven address bits, and a direction bit indicating the intent of executing a read or write operation.

The address of the TMP411A is 4Ch (1001100b). The address of the TMP411B is 4Dh (1001101b). The address of the TMP411C is 4Eh (1001110b).

## READ/WRITE OPERATIONS

Accessing a particular register on the TMP411 is accomplished by writing the appropriate value to the Pointer Register. The value for the Pointer Register is the first byte transferred after the slave address byte with the  $R/\overline{W}$  bit low. Every write operation to the TMP411 requires a value for the Pointer Register (see Figure 14).

When reading from the TMP411, the last value stored in the Pointer Register by a write operation is used to determine which register is read by a read operation. To change the register pointer for a read operation, a new value must be written to the Pointer Register. This transaction is accomplished by issuing a slave address byte with the  $R/\overline{W}$  bit low, followed by the Pointer Register byte. No additional data are required. The master can then generate a START condition and send the slave address byte with the  $R/\overline{W}$  bit high to initiate the read command. See Figure 15 for details of this sequence. If repeated reads from the same register are desired, it is not necessary to continually send the Pointer Register bytes, because the TMP411 retains the Pointer Register value until it is changed by the next write operation. Note that register bytes are sent MSB first, followed by the LSB.

**Table 11. THERM Hysteresis Register Format**

THERM HYSTERESIS REGISTER (Read = 21h, Write = 21h, POR = 0Ah)								
BIT #	D7	D6	D5	D4	D3	D2	D1	D0

POR VALUE	0	0	0	0	1	0	1	0

## TIMING DIAGRAMS

The TMP411 is Two-Wire and SMBus-compatible. Figure 13 to Figure 17 describe the various operations on the TMP411. Bus definitions are given below. Parameters for Figure 13 are defined in Table 12.

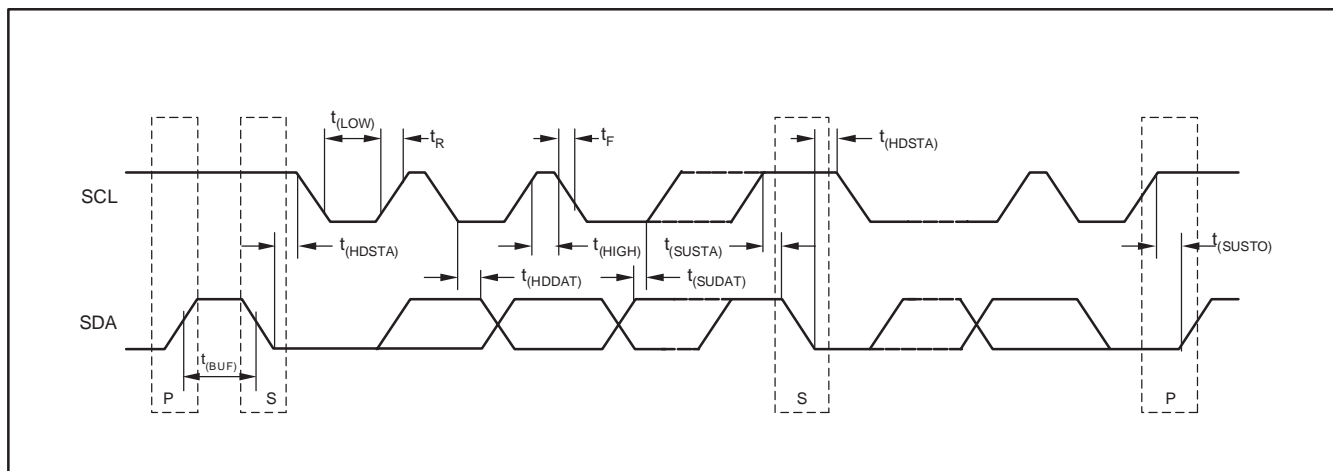

**Bus Idle:** Both SDA and SCL lines remain high.

**Start Data Transfer:** A change in the state of the SDA line, from high to low, while the SCL line is high, defines a START condition. Each data transfer is initiated with a START condition.

**Stop Data Transfer:** A change in the state of the SDA line from low to high while the SCL line is high defines a STOP condition. Each data transfer terminates with a STOP or a repeated START condition.

**Data Transfer:** The number of data bytes transferred between a START and a STOP condition is not limited and is determined by the master device. The receiver acknowledges the transfer of data.

**Acknowledge:** Each receiving device, when addressed, is obliged to generate an Acknowledge bit. A device that acknowledges must pull down the SDA line during the Acknowledge clock pulse in such a way that the SDA line is stable low during the high period of the Acknowledge clock pulse. Setup and hold times must be taken into account. On a master receive, data transfer termination can be signaled by the master generating a Not-Acknowledge on the last byte that has been transmitted by the slave.

**Figure 13. Two-Wire Timing Diagram**

**Table 12. Timing Diagram Definitions for Figure 13**

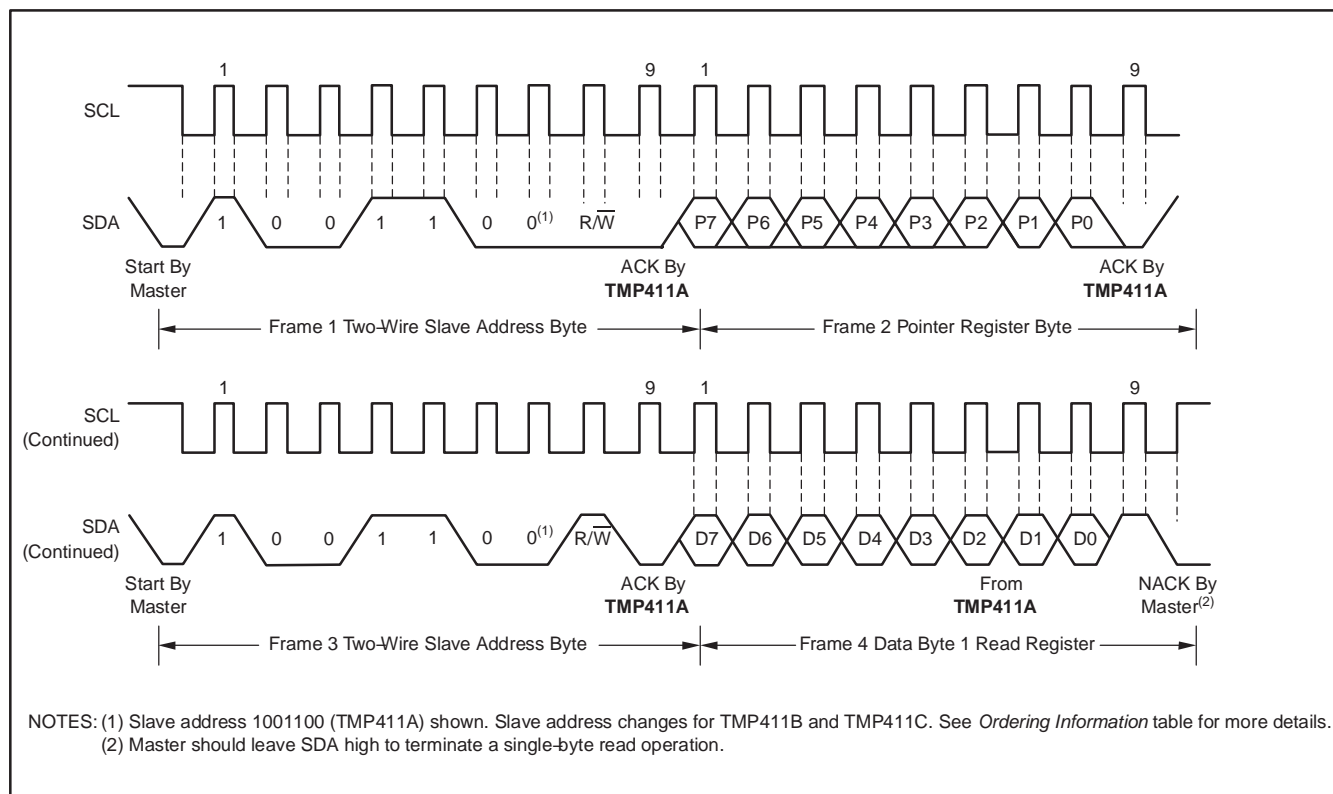

PARAMETER		FAST MODE		HIGH-SPEED MODE		UNITS
		MIN	MAX	MIN	MAX	
SCL Operating Frequency	$f_{(SCL)}$	0.001	0.4	0.001	3.4	MHz
Bus Free Time Between STOP and START Condition	$t_{(BUF)}$	600		160		ns
Hold time after repeated START condition. After this period, the first clock is generated.	$t_{(HDSTA)}$	100		100		ns
Repeated START Condition Setup Time	$t_{(SUSTA)}$	100		100		ns
STOP Condition Setup Time	$t_{(SUSTO)}$	100		100		ns
Data Hold Time	$t_{(HDDAT)}$	0(1)		0(2)		ns
Data Setup Time	$t_{(SUDAT)}$	100		10		ns
SCL Clock LOW Period	$t_{(LOW)}$	1300		160		ns
SCL Clock HIGH Period	$t_{(HIGH)}$	600		60		ns
Clock/Data Fall Time	$t_F$		300		160	ns
Clock/Data Rise Time	$t_R$		300		160	ns
for $SCLK \leq 100kHz$	$t_R$		1000			ns

(1) For cases with fall time of SCL less than 20ns and/or the rise time or fall time of SDA less than 20ns, the hold time should be greater than 20ns.

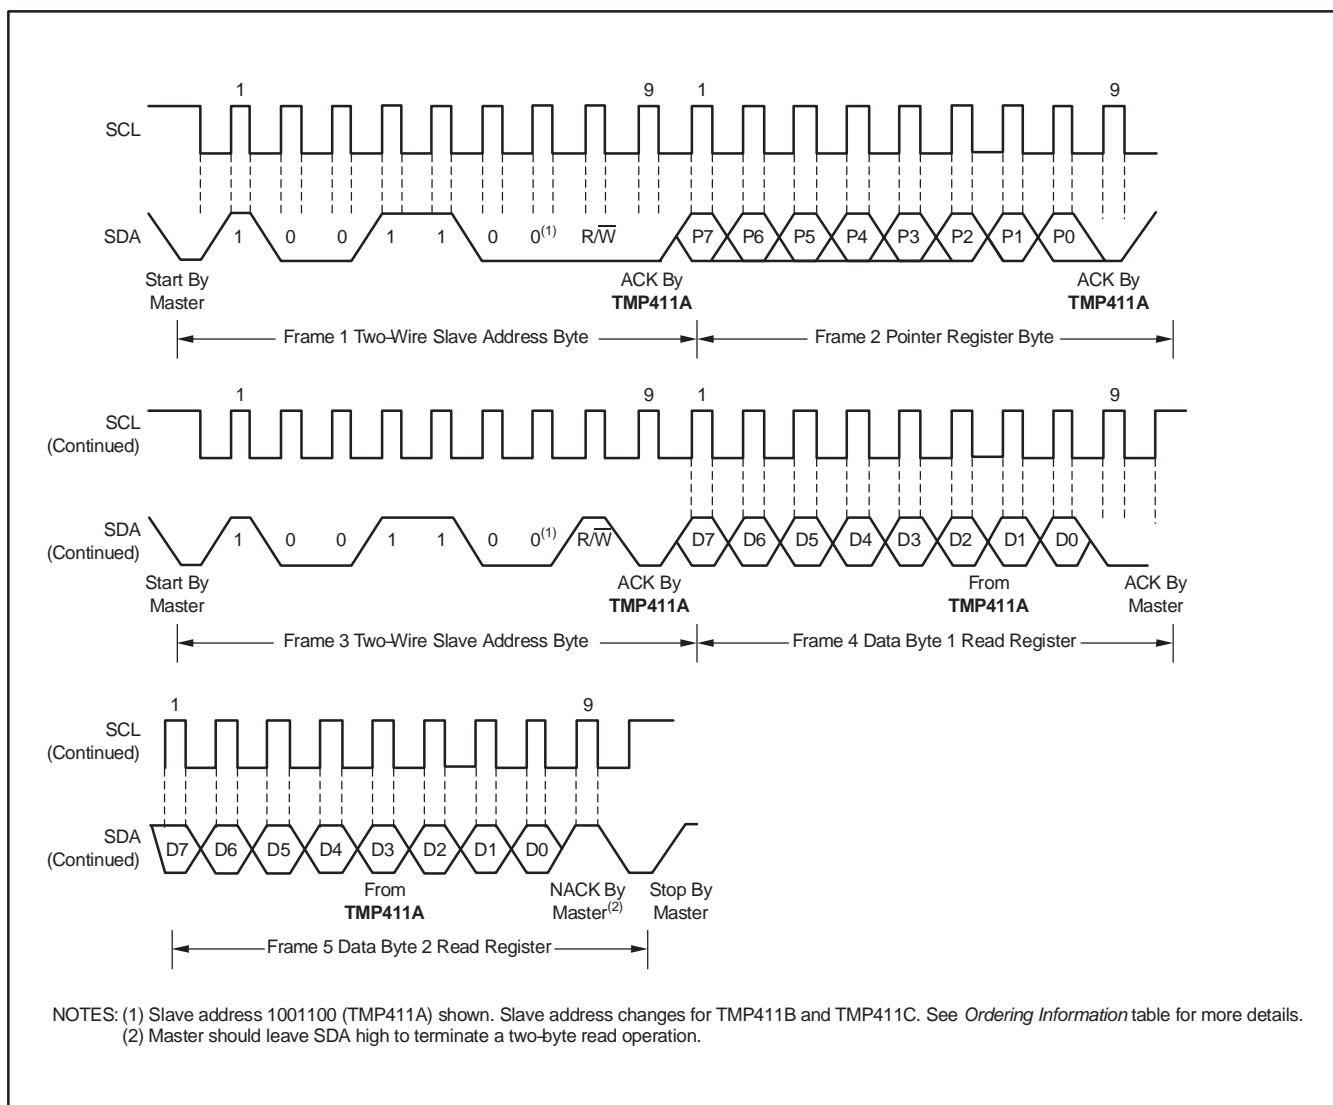

(2) For cases with fall time of SCL less than 10ns and/or the rise or fall time of SDA less than 10ns, the hold time should be greater than 10ns.

**Figure 15. Two-Wire Timing Diagram for Single-Byte Read Format**

**Figure 16. Two-Wire Timing Diagram for Two-Byte Read Format**

**Figure 17. Timing Diagram for SMBus ALERT**

## HIGH-SPEED MODE

In order for the Two-Wire bus to operate at frequencies above 400kHz, the master device must issue a High-speed mode (Hs-mode) master code (00001XXX) as the first byte after a START condition to switch the bus to high-speed operation. The TMP411 will not acknowledge this byte, but will switch the input filters on SDA and SCL and the output filter on SDA to operate in Hs-mode, allowing transfers at up to 3.4MHz. After the Hs-mode master code has been issued, the master transmits a Two-Wire slave address to initiate a data transfer operation. The bus continues to operate in Hs-mode until a STOP condition occurs on the bus. Upon receiving the STOP condition, the TMP411 switches the input and output filter back to fast-mode operation.

## TIMEOUT FUNCTION

When bit 7 of the Consecutive Alert Register is set high, the TMP411 timeout function is enabled. The TMP411 resets the serial interface if either SCL or SDA are held low for 30ms (typical) between a START and STOP condition. If the TMP411 is holding the bus low, it releases the bus and waits for a START condition. To avoid activating the timeout function, it is necessary to maintain a communication speed of at least 1kHz for the SCL operating frequency. The default state of the timeout function is enabled (bit 7 = high).

## THERM (PIN 4) AND ALERT/THERM2 (PIN 6)

The TMP411 has two pins dedicated to alarm functions, the  $\overline{\text{THERM}}$  and  $\overline{\text{ALERT/THERM2}}$  pins. Both pins are open-drain outputs that each require a pull-up resistor to V+. These pins can be wire-ORed together with other alarm pins for system monitoring of multiple sensors. The  $\overline{\text{THERM}}$  pin provides a thermal interrupt that cannot be software disabled. The  $\overline{\text{ALERT}}$  pin is intended for use as an earlier warning interrupt, and can be software disabled, or masked. The  $\overline{\text{ALERT/THERM2}}$  pin can also be

configured for use as  $\overline{\text{THERM2}}$ , a second  $\overline{\text{THERM}}$  pin (Configuration Register: AL/TH bit = 1). The default setting configures pin 6 to function as  $\overline{\text{ALERT}}$  (AL/TH = 0).

The  $\overline{\text{THERM}}$  pin asserts low when either the measured local or remote temperature is outside of the temperature range programmed in the corresponding Local/Remote THERM Limit Register. The THERM temperature limit range can be programmed with a wider range than that of the limit registers, which allows  $\overline{\text{ALERT}}$  to provide an earlier warning than  $\overline{\text{THERM}}$ . The  $\overline{\text{THERM}}$  alarm resets automatically when the measured temperature returns to within the THERM temperature limit range minus the hysteresis value stored in the THERM Hysteresis Register. The allowable values of hysteresis are shown in Table 10. The default hysteresis is 10°C. When the  $\overline{\text{ALERT/THERM2}}$  pin is configured as a second thermal alarm (Configuration Register: bit 7 = 0, bit 5 = 1), it functions the same as  $\overline{\text{THERM}}$ , but uses the temperatures stored in the Local/Remote Temperature High/Low Limit Registers to set its comparison range.

When  $\overline{\text{ALERT/THERM2}}$  (pin 6) is configured as  $\overline{\text{ALERT}}$  (Configuration Register: bit 7 = 0, bit 5 = 0), the pin asserts low when either the measured local or remote temperature violates the range limit set by the corresponding Local/Remote Temperature High/Low Limit Registers. This alert function can be configured to assert only if the range is violated a specified number of consecutive times (1, 2, 3, or 4). The consecutive violation limit is set in the Consecutive Alert Register. False alerts that occur as a result of environmental noise can be prevented by requiring consecutive faults.  $\overline{\text{ALERT}}$  also asserts low if the remote temperature sensor is open-circuit. When the MASK function is enabled (Configuration Register: bit 7 = 1),  $\overline{\text{ALERT}}$  is disabled (that is, masked).  $\overline{\text{ALERT}}$  resets when the master reads the device address, as long as the condition that caused the alert no longer persists, and the Status Register has been reset.

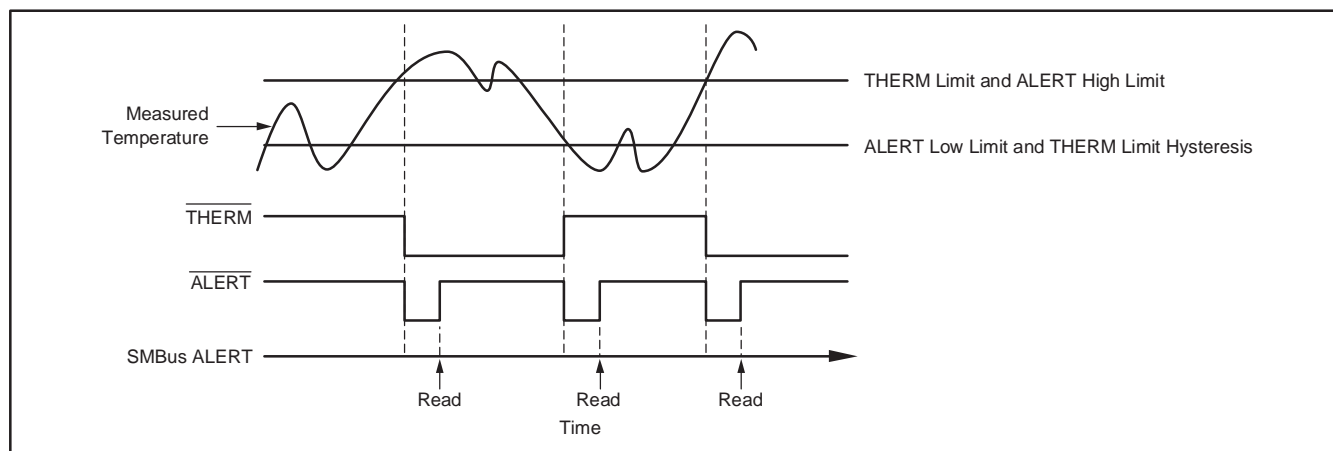

Figure 18. SMBus Alert Timing Diagram

## SMBUS ALERT FUNCTION

The TMP411 supports the SMBus Alert function. When pin 6 is configured as an alert output, the  $\overline{\text{ALERT}}$  pin of the TMP411 may be connected as an SMBus Alert signal. When a master detects an alert condition on the  $\overline{\text{ALERT}}$  line, the master sends an SMBus Alert command (00011001) on the bus. If the  $\overline{\text{ALERT}}$  pin of the TMP411 is active, the devices will acknowledge the SMBus Alert command and respond by returning its slave address on the SDA line. The eighth bit (LSB) of the slave address byte indicates whether the temperature exceeding one of the temperature high limit settings or falling below one of the temperature low limit settings caused the alert condition. This bit will be high if the temperature is greater than or equal to one of the temperature high limit settings; this bit will be low if the temperature is less than one of the temperature low limit settings. See Figure 17 for details of this sequence.

If multiple devices on the bus respond to the SMBus Alert command, arbitration during the slave address portion of the SMBus Alert command determines which device will clear its alert status. If the TMP411 wins the arbitration, its  $\overline{\text{ALERT}}$  pin becomes inactive at the completion of the SMBus Alert command. If the TMP411 loses the arbitration, the  $\overline{\text{ALERT}}$  pin remains active.

## SHUTDOWN MODE (SD)

The TMP411 Shutdown Mode allows the user to save maximum power by shutting down all device circuitry other than the serial interface, reducing current consumption to typically less than 3 $\mu$ A; see typical characteristic curve *Shutdown Quiescent Current vs Supply Voltage*. Shutdown Mode is enabled when the SD bit of the Configuration Register is high; the device shuts down once the current conversion is completed. When SD is low, the device maintains a continuous conversion state.

## SENSOR FAULT

The TMP411 will sense a fault at the D+ input resulting from incorrect diode connection or an open circuit. The detection circuitry consists of a voltage comparator that trips when the voltage at D+ exceeds (V+) – 0.6V (typical). The comparator output is continuously checked during a conversion. If a fault is detected, the last valid measured temperature is used for the temperature measurement result, the OPEN bit (Status Register, bit 2) is set high, and, if the alert function is enabled,  $\overline{\text{ALERT}}$  asserts low.

When not using the remote sensor with the TMP411, the D+ and D– inputs must be connected together to prevent meaningless fault warnings.

## UNDER-VOLTAGE LOCKOUT

The TMP411 senses when the power-supply voltage has reached a minimum voltage level for the ADC converter to function. The detection circuitry consists of a voltage comparator that enables the ADC converter after the power supply (V+) exceeds 2.45V (typical). The comparator output is continuously checked during a conversion. The TMP411 will not perform a temperature conversion if the power supply is not valid. The last valid measured temperature is used for the temperature measurement result.

## GENERAL CALL RESET

The TMP411 supports reset via the Two-Wire General Call address 00h (0000 0000b). The TMP411 acknowledges the General Call address and responds to the second byte. If the second byte is 06h (0000 0110b), the TMP411 executes a software reset. This software reset restores the power-on reset state to all TMP411 registers, aborts any conversion in progress, and clears the  $\overline{\text{ALERT}}$  and THERM pins. The TMP411 takes no action in response to other values in the second byte.

## IDENTIFICATION REGISTERS

The TMP411 allows for the Two-Wire bus controller to query the device for manufacturer and device IDs. This feature allows for software identification of the device at the particular Two-Wire bus address. The manufacturer ID is obtained by reading from pointer address FEh. The TMP411 manufacturer code is 55h. The device ID depends on the specific model; see the Register Map (Table 3). These registers are read-only.

## FILTERING

Remote junction temperature sensors are usually implemented in a noisy environment. Noise is most often created by fast digital signals, and it can corrupt measurements. The TMP411 has a built-in 65kHz filter on the inputs of D+ and D– to minimize the effects of noise. However, a bypass capacitor placed differentially across the inputs of the remote temperature sensor is recommended to make the application more robust against unwanted coupled signals. The value of the capacitor should be between 100pF and 1nF. Some applications attain better overall accuracy with additional series resistance; however, this increased accuracy is setup-specific. When series resistance is added, the value should not be greater than 3k $\Omega$ .

If filtering is needed, the suggested component values are 100pF and 50 $\Omega$  on each input. Exact values are application-specific.

## REMOTE SENSING

The TMP411 is designed to be used with either discrete transistors or substrate transistors built into processor chips and ASICs. Either NPN or PNP transistors can be used, as long as the base-emitter junction is used as the remote temperature sense. Either a transistor or diode connection can also be used; see Figure 11.

Errors in remote temperature sensor readings will be the consequence of the ideality factor and current excitation used by the TMP411 versus the manufacturer-specified operating current for a given transistor. Some manufacturers specify a high-level and low-level current for the temperature-sensing substrate transistors. The TMP411 uses 6µA for  $I_{LOW}$  and 120µA for  $I_{HIGH}$ . The TMP411 allows for different  $n$ -factor values; see the *N-Factor Correction Register* section.

The ideality factor ( $n$ ) is a measured characteristic of a remote temperature sensor diode as compared to an ideal diode. The ideality factor for the TMP411 is trimmed to be 1.008. For transistors whose ideality factor does not match the TMP411, Equation 4 can be used to calculate the temperature error. Note that for the equation to be used correctly, actual temperature (°C) must be converted to Kelvin (°K).

$$T_{ERR} = \left( \frac{n - 1.008}{1.008} \right) \times (273.15 + T(^{\circ}C)) \quad (4)$$

Where:

$n$  = Ideality factor of remote temperature sensor  
 $T(^{\circ}C)$  = actual temperature  
 $T_{ERR}$  = Error in TMP411 reading due to  $n \neq 1.008$   
 Degree delta is the same for °C and °K

For  $n = 1.004$  and  $T(^{\circ}C) = 100^{\circ}C$ :

$$\begin{aligned} T_{ERR} &= \left( \frac{1.004 - 1.008}{1.008} \right) \times (273.15 + 100^{\circ}C) \\ T_{ERR} &= -1.48^{\circ}C \end{aligned} \quad (5)$$

If a discrete transistor is used as the remote temperature sensor with the TMP411, the best accuracy can be achieved by selecting the transistor according to the following criteria:

1. Base-emitter voltage > 0.25V at 6µA, at the highest sensed temperature.
2. Base-emitter voltage < 0.95V at 120µA, at the lowest sensed temperature.

3. Base resistance < 100Ω.
4. Tight control of  $V_{BE}$  characteristics indicated by small variations in  $h_{FE}$  (that is, 50 to 150).

Based on these criteria, two recommended small-signal transistors are the 2N3904 (NPN) or 2N3906 (PNP).

## MEASUREMENT ACCURACY AND THERMAL CONSIDERATIONS

The temperature measurement accuracy of the TMP411 depends on the remote and/or local temperature sensor being at the same temperature as the system point being monitored. Clearly, if the temperature sensor is not in good thermal contact with the part of the system being monitored, then there will be a delay in the response of the sensor to a temperature change in the system. For remote temperature sensing applications using a substrate transistor (or a small, SOT23 transistor) placed close to the device being monitored, this delay is usually not a concern.

The local temperature sensor inside the TMP411 monitors the ambient air around the device. The thermal time constant for the TMP411 is approximately two seconds. This constant implies that if the ambient air changes quickly by 100°C, it would take the TMP411 about 10 seconds (that is, five thermal time constants) to settle to within 1°C of the final value. In most applications, the TMP411 package is in electrical and therefore thermal contact with the printed circuit board (PCB), as well as subjected to forced airflow. The accuracy of the measured temperature directly depends on how accurately the PCB and forced airflow temperatures represent the temperature that the TMP411 is measuring. Additionally, the internal power dissipation of the TMP411 can cause the temperature to rise above the ambient or PCB temperature. The internal power dissipated as a result of exciting the remote temperature sensor is negligible because of the small currents used. For a 5.5V supply and maximum conversion rate of eight conversions per second, the TMP411 dissipates 1.82mW ( $PD_{IQ} = 5.5V \times 330\mu A$ ). If both the  $\overline{ALERT}/THERM2$  and  $THERM$  pins are each sinking 1mA, an additional power of 0.8mW is dissipated ( $PD_{OUT} = 1mA \times 0.4V + 1mA \times 0.4V = 0.8mW$ ). Total power dissipation is then 2.62mW ( $PD_{IQ} + PD_{OUT}$ ) and, with an  $\theta_{JA}$  of 150°C/W, causes the junction temperature to rise approximately 0.393°C above the ambient.

## LAYOUT CONSIDERATIONS

Remote temperature sensing on the TMP411 measures very small voltages using very low currents; therefore, noise at the IC inputs must be minimized. Most applications using the TMP411 will have high digital content, with several clocks and logic level transitions creating a noisy environment. Layout should adhere to the following guidelines:

1. Place the TMP411 as close to the remote junction sensor as possible.
2. Route the D+ and D– traces next to each other and shield them from adjacent signals through the use of ground guard traces, as shown in Figure 19. If a multilayer PCB is used, bury these traces between ground or  $V_{DD}$  planes to shield them from extrinsic noise sources. 5 mil PCB traces are recommended.
3. Minimize additional thermocouple junctions caused by copper-to-solder connections. If these junctions are used, make the same number and approximate locations of copper-to-solder connections in both the D+ and D– connections to cancel any thermocouple effects.
4. Use a 0.1  $\mu$ F local bypass capacitor directly between the V+ and GND of the TMP411, as shown in Figure 20. Minimize filter capacitance between D+ and D– to 1000pF or less for optimum measurement performance. This capacitance includes any cable capacitance between the remote temperature sensor and TMP411.
5. If the connection between the remote temperature sensor and the TMP411 is less than 8 inches, use a twisted-wire pair connection. Beyond 8 inches, use a twisted, shielded pair with the shield grounded as close to the TMP411 as possible. Leave the remote sensor connection end of the shield wire open to avoid ground loops and 60Hz pickup.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

### Products

Audio	<a href="http://www.ti.com/audio">www.ti.com/audio</a>
Amplifiers	<a href="http://amplifier.ti.com">amplifier.ti.com</a>
Data Converters	<a href="http://dataconverter.ti.com">dataconverter.ti.com</a>
DLP® Products	<a href="http://www.dlp.com">www.dlp.com</a>
DSP	<a href="http://dsp.ti.com">dsp.ti.com</a>
