

3.3-V/5-V Input, D-CAP+™ Mode Synchronous Step-Down Integrated FETs Converter With 2-Bit VID

Check for Samples: [TPS51463](#)

FEATURES

- Integrated FETs Converter w/TI Proprietary D-CAP+™ Mode Architecture
- Minimum External Parts Count
- Support all MLCC Output Capacitor and SP/POSCAP
- Auto Skip Mode
- Selectable 700-kHz and 1-MHz Frequency
- Small 4 mm × 4 mm, 24-Pin, QFN Package

APPLICATIONS

- Low-Voltage Applications Stepping Down from 5-V or 3.3-V Rail
- Notebook/Desktop Computers
- Intel® Chief River Platform ULV CPU System Agent

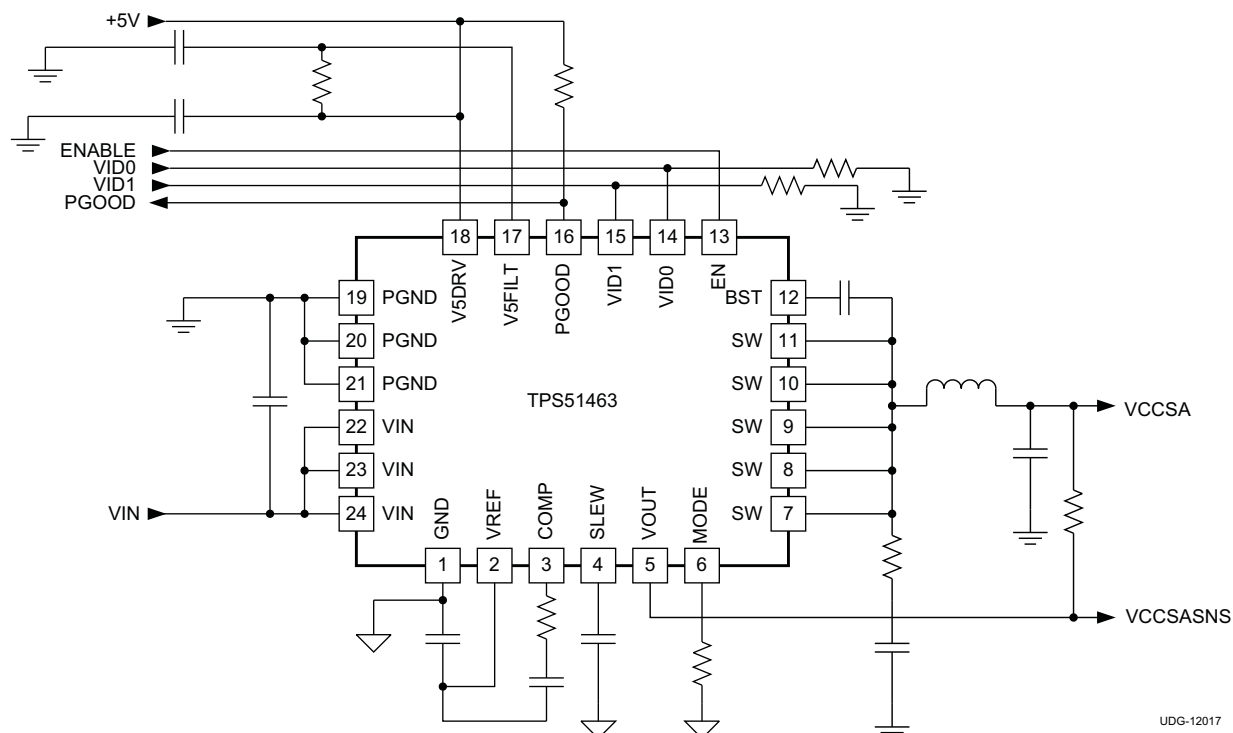

DESCRIPTION

The TPS51463 is a fully integrated synchronous buck regulator employing D-CAP+™. It is used for up to 5-V step-down where system size is at its premium, performance and optimized BOM are must-haves.

The TPS51463 fully supports the Intel® Chief River platform, a ULV/CPU system agent application with integrated 2-bit VID function.

The TPS51463 also features two switching frequency settings (700 kHz and 1 MHz), skip mode, pre-bias startup, programmable external capacitor soft-start time/voltage transition time, output discharge, internal VBST Switch, 2-V reference ($\pm 1\%$), power good and enable.

The TPS51463 is available in a 4 mm × 4 mm, 24-pin, QFN package (Green RoHs compliant and Pb free) and is specified from -40°C to 85°C.

PIN FUNCTIONS

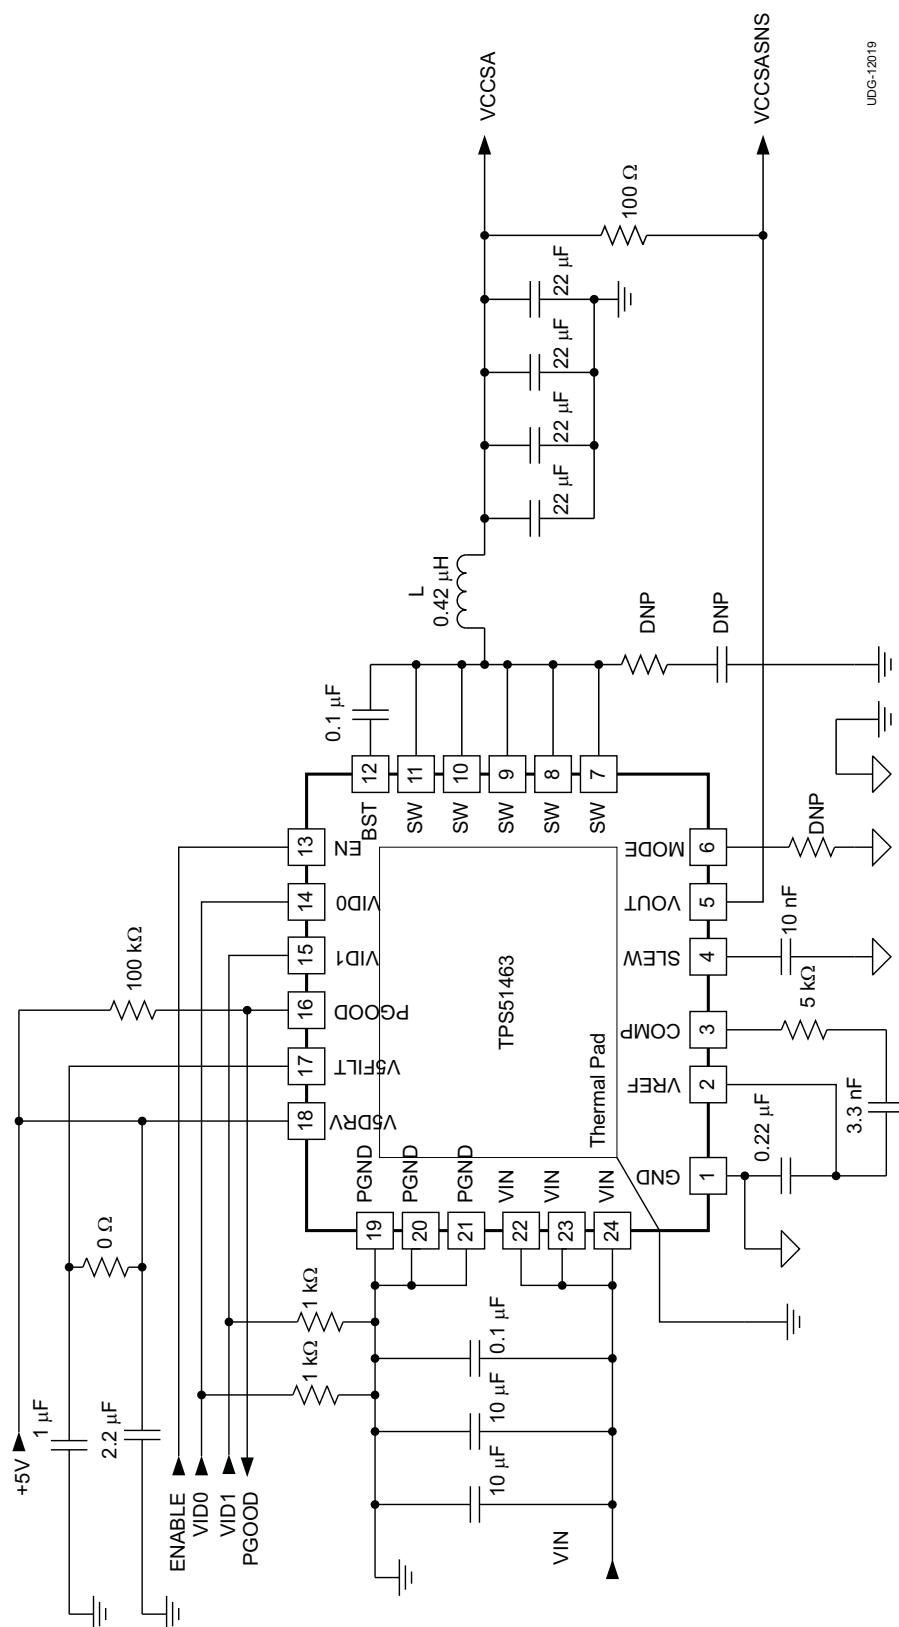

PIN		I/O	DESCRIPTION
NO.	NAME		
19	PGND	I	Power ground. Source terminal of the rectifying low-side power FET.
20			
21			
22	VIN	I	Power supply input pin. Drain terminal of the switching high-side power FET.
23			
24			
1	GND	–	Signal ground.
2	VREF	O	2.0-V reference output. Connect a 0.22-μF ceramic capacitor to GND.
3	COMP	O	Connect series R-C to the VREF pin for loop compensation.
4	SLEW	I/O	Program the startup and voltage transition time using an external capacitor via 10-μA current source.
5	VOUT	I	Output voltage monitor input pin.
6	MODE	I	Allows selection of switching frequencies. (See Table 3)
7	SW	I/O	Switching node output. Connect to the external inductor.
8			
9			
10			
11			
12	BST	I	Power supply for internal high-side gate driver. Connect a 0.1-μF bootstrap capacitor between this pin and the SW pin.
13	EN	I	Enable of the SMPS.
14	VID0	I	2-bit VID input.
15	VID1		
16	PGOOD	O	Power good output. Connect pull-up resistor.
17	V5FILT	I	5-V power supply for analog circuits.
18	V5DRV	I	5-V power supply for the gate driver.
Thermal Pad		–	Connect directly to system GND plane with multiple vias.

	Murata	GRM21BR60J226ME39L

APPLICATION INFORMATION

Functional Overview

The TPS51463 is a D-CAP+™ mode adaptive on-time converter. The output voltage is set using a 2-bit DAC that outputs a reference voltage in accordance with the code defined in [Table 1](#). *VID-on-the-fly* transitions are supported with the slew rate controlled by a single capacitor on the SLEW pin. The converter automatically runs in discontinuous conduction mode (DCM) to optimize light-load efficiency. Two switching frequency selections are provided, (700 kHz and 1 MHz) to enable optimization of the power chain for the cost, size and efficiency requirements of the design.

In adaptive on-time converters, the controller varies the on-time as a function of input and output voltage to maintain a nearly constant frequency during steady-state conditions. In conventional constant on-time converters, each cycle begins when the output voltage crosses to a fixed reference level. However, in the TPS51463, the cycle begins when the current feedback reaches an error voltage level which is the amplified difference between the reference voltage and the feedback voltage.

PWM Operation

Referring to [Figure 2](#), in steady state, continuous conduction mode, the converter operates in the following way.

Starting with the condition that the top FET is off and the bottom FET is on, the current feedback (V_{CS}) is higher than the error amplifier output (V_{COMP}). V_{CS} falls until it hits V_{COMP} , which contains a component of the output ripple voltage. V_{CS} is not directly accessible by measuring signals on pins of TPS51463. The PWM comparator senses where the two waveforms cross and triggers the on-time generator.

UDG-10187

Figure 2. D-CAP+™ Mode Basic Waveforms

The current feedback is an amplified and filtered version of the voltage between PGND and SW during low-side FET on-time. The TPS51463 also provides a single-ended differential voltage (V_{OUT}) feedback to increase the system accuracy and reduce the dependence of circuit performance on layout.

PWM Frequency and Adaptive on Time Control

In general, the on-time (at the SW node) can be estimated by Equation 1.

$$t_{ON} = \frac{V_{OUT}}{V_{IN}} \times \frac{1}{f_{SW}}$$

where

- f_{sw} is the frequency selected by the connection of the MODE pin (1)

The on-time pulse is sent to the top FET. The inductor current and the current feedback rises to peak value. Each ON pulse is latched to prevent double pulsing. Switching frequency settings are shown in [Table 3](#).

Non-Droop Configuration

The TPS51463 offers a non-droop solution only. The benefit of a non-droop approach is that load regulation is flat, therefore, in a system where tight DC tolerance is desired, the non-droop approach is recommended. For the Intel system agent application, non-droop is recommended as the standard configuration.

The non-droop approach can be implemented by connecting a resistor and a capacitor between the COMP and the VREF pins. The purpose of the type II compensation is to obtain high DC feedback gain while minimizing the phase delay at unity gain cross over frequency of the converter.

The value of the resistor (R_C) can be calculated using the desired unity gain bandwidth of the converter, and the value of the capacitor (C_C) can be calculated by knowing where the zero location is desired. An application tool that calculates these values is available from your local TI Field Application Engineer.

Figure 3 shows the basic implementation of the non-droop mode using the TPS51463.

UDG-11208

Figure 3. Non-Droop Mode Basic Implementation

Figure 4 shows the load regulation of the system agent rail using non-droop configuration.

Figure 5 shows the transient response of TPS51463 using non-droop configuration where $C_{OUT} = 4 \times 22 \mu\text{F}$. The applied step load is from 0 A to 2 A.

Figure 4. 0.85-V Load Regulation

Figure 5. Transient Response

Table 3. Mode Parameter Table

MODE	MODE CONNECTION	SWITCHING FREQUENCY (f_{sw})	VID1 = 1 VID0 = 0
7	100 kΩ	700 kHz	0.85 V
8	Open	1 MHz	0.85 V

Light Load Power Saving Features

The TPS51463 has an automatic pulse-skipping mode to provide excellent efficiency over a wide load range. The converter senses inductor current and prevents negative flow by shutting off the low-side gate driver. This saves power by eliminating re-circulation of the inductor current. Further, when the bottom FET shuts off, the converter enters discontinuous mode, and the switching frequency decreases, thus reducing switching losses as well.

Voltage Slewing

The TPS51463 ramps the SLEW voltage up and down to perform the output voltage transitioning. The timing is independent of switching frequency, as well as output resistive and capacitive loading. It is set by a capacitor from SLEW pin to GND, called C_{SLEW} , together with an internal current source of 10 μA . The slew rate is used to set the startup and voltage transition rate.

$$C_{SLEW} = \frac{I_{SLEW}}{SR} \quad (2)$$

$$t_{SS} = \frac{C_{SLEW} \times 0.9 \text{ V}}{I_{SLEW}}$$

where

- $I_{SLEW} = 10 \mu\text{A}$ (nom)
- SR is the target output voltage slew rate, per Intel specification between 0.5 mV/ μs and 10 mV/ μs (3)

For the current reference design, an SR of 1 mV/ μs is targeted. The C_{SLEW} is calculated to be 10 nF. The slower slew rate is desired to minimize large inductor current perturbation during startup and voltage transitioning thus reducing the possibility of acoustic noise.

After the power up, when VID1 is transitioning from 0 to 1, TPS51463 follows the SLEW voltage entering the forced PWM mode to actively discharge the output voltage from 0.9 V to 0.85 V. The actual output voltage slew rate is approximately the same as the set slew rate while the bandwidth of the converter supports it and there is no overcurrent triggered by additional charging current flowing into the output capacitors. After SLEW transition is completed, PWM mode is maintained for 64 μs (16 clock cycles when the frequency is 1 MHz) to ensure voltage regulation.

Protection Features

The TPS51463 offers many features to protect the converter power chain as well as the system electronics.

5-V Undervoltage Protection (UVLO)

The TPS51463 continuously monitors the voltage on the V5FILT pin to ensure that the voltage level is high enough to bias the device properly and to provide sufficient gate drive potential to maintain high efficiency. The converter starts with approximately 4.3 V and has a nominal of 440 mV of hysteresis. If the 5-V UVLO limit is reached, the converter transitions the phase node into a 3-state function. And the converter remains in the off state until the device is reset by cycling 5 V until the 5-V POR is reached (2.3-V nominal). The power input does not have an UVLO function

Power Good Signals

The TPS51463 has one open-drain *power good* (PGOOD) pin. During startup, there is a 3 ms power good delay starting from the output voltage reaching the regulation point (excluding soft-start ramp-up time). And there is also a 1 ms power good high propagation delay. The PGOOD pin de-asserts as soon as the EN pin is pulled low or an undervoltage condition on V5FILT is detected. The PGOOD signal is blanked during VID voltage transitions to prevent false triggering during voltage slewing.

Output Overvoltage Protection (OVP)

In addition to the power good function described above, the TPS51463 has additional OVP and UVP thresholds and protection circuits.

An OVP condition is detected when the output voltage is approximately $120\% \times V_{SLEW}$. In this case, the converter de-asserts the PGOOD signals and performs the overvoltage protection function. The converter remains in this state until the device is reset by cycling 5 V until the 5-V POR threshold (2.3 V nominal) is reached.

Output Undervoltage Protection (UVP)

Output undervoltage protection works in conjunction with the current protection described in the [Overcurrent Protection](#) and [Overcurrent Limit](#) sections. If the output voltage drops below 70% of V_{SLEW} , after an 8-μs delay, the device latches OFF. Undervoltage protection can be reset only by EN or a 5-V POR.

Overcurrent Protection

Both positive and negative overcurrent protection are provided in the TPS51463:

- Overcurrent Limit (OCL)
- Negative OCL (level same as positive OCL)

Overcurrent Limit

If the sensed current value is above the OCL setting, the converter delays the next ON pulse until the current drops below the OCL limit. Current limiting occurs on a pulse-by-pulse basis. The TPS51463 uses a valley current limiting scheme where the DC OCL trip point is the OCL limit plus half of the inductor ripple current. The minimum valley OCL is 4 A over process and temperature.

During the overcurrent protection event, the output voltage likely droops until the UVP limit is reached. Then, the converter de-asserts the PGOOD pin, and then latches OFF after an 8-μs delay. The converter remains in this state until the device is reset by EN or a 5VFILT POR.

$$I_{OCL(dc)} = I_{OCL(valley)} + \frac{1}{2} \times I_{P-P} \quad (4)$$

Negative OCL

The negative OCL circuit acts when the converter is sinking current from the output capacitor(s). The converter continues to act in a *valley* mode, the absolute value of the negative OCL set point is typically -5 A.

Thermal Protection

Thermal Shutdown

The TPS51463 has an internal temperature sensor. When the temperature reaches a nominal 125°C, the device shuts down until the temperature cools by approximately 10°C. Then the converter restarts.

DESIGN PROCEDURE

The simplified design procedure steps using the TPS51463 converter application are outlined in this section.

Step One

Determine the specifications.

The System Agent Rail requirements provide the following key parameters:

1. $V_{00} = 0.90\text{ V}$
2. $V_{10} = 0.85\text{ V}$
3. $I_{CC(max)} = 4\text{ A}$
4. $I_{DYN(max)} = 2\text{ A}$
5. $I_{CC(tdc)} = 3\text{ A}$

Step Two

Determine system parameters.

The input voltage range and operating frequency are of primary interest. For example:

1. $V_{IN} = 5\text{ V}$
2. $f_{SW} = 1\text{ MHz}$

Step Three

Determine inductor value and choose inductor.

Smaller values of inductor have better transient performance but higher ripple and lower efficiency. Higher values have the opposite characteristics. It is common practice to limit the ripple current to 25% to 50% of the maximum current. In this case, use 37.5%:

$$I_{P-P} = 4\text{ A} \times 0.375 = 1.5\text{ A} \quad (5)$$

At $f_{SW} = 1\text{ MHz}$, with a 5-V input and a 0.85-V output:

$$L = \frac{V \times dT}{I_{P-P}} = \frac{(V_{IN} - V_{10}) \times \left(\frac{V_{10}}{f_{SW} \times V_{IN}} \right)}{I_{P-P}} = \frac{(5 - 0.85) \times \left(\frac{0.85}{(1 \times 5)} \right)}{1.5\text{ A}} = 0.47\text{ }\mu\text{H} \quad (6)$$

For this application, a 0.42- μH , 1.55-m Ω inductor from NEC-TOKIN with part number MPCG0740LR42C is chosen.

Step Four

Set the output voltage.

The output voltage is determined by the VID settings. The actual voltage set point for each VID setting is listed in [Table 1](#). No external resistor dividers are needed for this design.

Step Five

Calculate C_{SLEW} .

VID pin transition and soft-start time is determined by C_{SLEW} and 10 μA of internal current source.

$$C_{SLEW} = \frac{I_{SLEW}}{SR_{DAC}} = \frac{10\text{ }\mu\text{A}}{1\text{ mV}/\mu\text{s}} = 10\text{ nF} \quad (7)$$

The slower slew rate is desired to minimize large inductor current perturbation during startup and voltage transition, thus reducing the possibility of acoustic noise.

Given the C_{SLEW} , use [Equation 8](#) to calculate the soft start time.

$$t_{SS} = \frac{C_{SLEW} \times 0.9V}{I_{SLEW}} = \frac{10nF \times 0.9V}{10\mu A} = 900 \mu s \quad (8)$$

Step Six

Calculate OCL.

The DC OCL level of TPS51463 design is determined by [Equation 9](#),

$$I_{OCL(dc)} = I_{OCL(valley)} + \frac{1}{2} \times I_{P-P} = 4A + \frac{1}{2} \times 1.5A = 4.75A \quad (9)$$

The minimum valley OCL is 4 A over process and temperature, and $I_{P-P} = 1.5 A$, the minimum DC OCL is calculated to be 4.75A.

Step Seven

Determine the output capacitance.

To determine C_{OUT} based on transient and stability requirement, first calculate the the minimum output capacitance for a given transient.

[Equation 11](#) and [Equation 10](#) can be used to estimate the amount of capacitance needed for a given dynamic load step/release. Please note that there are other factors that may impact the amount of output capacitance for a specific design, such as ripple and stability. [Equation 11](#) and [Equation 10](#) are used only to estimate the transient requirement, the result should be used in conjunction with other factors of the design to determine the necessary output capacitance for the application.

$$C_{OUT(min_under)} = \frac{L \times \Delta I_{LOAD(max)}^2 \times \left(\frac{V_{VOUT} \times t_{SW}}{V_{IN(min)}} + t_{MIN(off)} \right)}{2 \times \Delta V_{LOAD(insert)} \times \left(\left(\frac{V_{IN(min)} - V_{VOUT}}{V_{IN(min)}} \right) \times t_{SW} - t_{MIN(off)} \right) \times V_{VOUT}} \quad (10)$$

$$C_{OUT(min_over)} = \frac{L_{OUT} \times (\Delta I_{LOAD(max)})^2}{2 \times \Delta V_{LOAD(release)} \times V_{VOUT}} \quad (11)$$

[Equation 10](#) and [Equation 11](#) calculate the minimum C_{OUT} for meeting the transient requirement, which is 78.6 μF , given the following parameters:

- $\pm 3\%$ voltage allowance for load step and release
- MLCC capacitance derating of 50% due to DC and AC bias effect

In this reference design, 4, 22- μF capacitors are used in order to provide this amount of capacitance.

Step Eight

Determine the stability based on the output capacitance C_{OUT} .

In order to achieve stable operation. The 0-dB frequency, f_0 should be kept less than 1/5 of the switching frequency (1 MHz). (See [Figure 3](#))

$$f_0 = \frac{1}{2\pi} \times \frac{G_M}{C_{OUT}} \times \frac{R_C}{R_S} = 150 \text{ kHz}$$

where

$$R_S = R_{DS(on)} \times G_{MC} \times R_{LOAD} \quad (12)$$

$$R_C = \frac{f_0 \times R_S \times 2\pi \times C_{OUT}}{G_M} = \frac{150 \text{ kHz} \times 53 \text{ m}\Omega \times 2\pi \times 88 \mu\text{F}}{1 \text{ mS}} \approx 5 \text{ k}\Omega \quad (13)$$

Using 4, 22- μF capacitors, the compensation resistance, R_C can be calculated to be approximately 5 k Ω .

The purpose of the comparator capacitor (C_C) is to reduce the DC component to obtain high DC feedback gain. However, as it causes phase delay, another zero to cancel this effect at f_0 is needed. This zero can be determined by values of C_C and the compensation resistor, R_C .

$$f_z = \frac{1}{2\pi \times R_C \times C_C} = \frac{f_0}{10} \quad (14)$$

And since R_C has previously been derived, the value of C_C is calculated to be 2.2 nF. In order to further boost phase margin, a value of 3.3-nF is chosen for this reference design.

Step Nine

Select decoupling and peripheral components.

For TPS51463 peripheral capacitors use the following minimum values of ceramic capacitance. X5R or better temperature coefficient is recommended. Tighter tolerances and higher voltage ratings are always appropriate.

- V5DRV decoupling $\geq 2.2 \mu\text{F}$, $\geq 10 \text{ V}$
- V5FILT decoupling $\geq 1 \mu\text{F}$, $\geq 10 \text{ V}$
- VREF decoupling 0.22 μF to 1 μF , $\geq 4 \text{ V}$
- Bootstrap capacitors $\geq 0.1 \mu\text{F}$, $\geq 10 \text{ V}$
- Pull-up resistors on PGOOD, 100 k Ω

Layout Considerations

Good layout is essential for stable power supply operation. Follow these guidelines for an efficient PCB layout.

- Connect PGND pins (or at least one of the pins) to the thermal PAD underneath the device. Also connect GND pin to the thermal PAD underneath the device. Use four vias to connect the thermal pad to internal ground planes.
- Place VIN, V5DRV, V5FILT and 2VREF decoupling capacitors as close to the device as possible.
- Use wide traces for the VIN, VOUT, PGND and SW pins. These nodes carry high current and also serve as heat sinks.
- Place feedback and compensation components as close to the device as possible.
- Keep analog signals (SLEW, COMP) away from noisy signals (SW, VBST).

PACKAGING INFORMATION

Orderable Device	Status ⁽¹⁾	Package Type	Package Drawing	Pins	Package Qty	Eco Plan ⁽²⁾	Lead/ Ball Finish	MSL Peak Temp ⁽³⁾	Samples (Requires Login)
TPS51463RGER	ACTIVE	VQFN	RGE	24	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	
TPS51463RGET	ACTIVE	VQFN	RGE	24	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC QUAD FLATPACK NO-LEAD

4204104/G 07/11

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Quad Flatpack, No-Leads (QFN) package configuration.
 - D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - F. Falls within JEDEC MO-220.

THERMAL PAD MECHANICAL DATA

RGE (S-PVQFN-N24)

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

4206344-6/AA 04/12

NOTES: A. All linear dimensions are in millimeters

RGE (S-PVQFN-N24)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46C and to discontinue any product or service per JESD48B. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
