# 36-V, 1-A, 4.17-μV<sub>RMS</sub>, RF LDO Voltage Regulator

Check for Samples: TPS7A4700, TPS7A4701

## **FEATURES**

- Input Voltage Range: +3 V to +36 V
- Output Voltage Noise:
   4.17 µV<sub>RMS</sub> (10 Hz, 100 kHz)
- Power-Supply Ripple Rejection:
  - 82 dB (100 Hz)
  - ≥ 55 dB (10 Hz, 10 MHz)
- Available in Two Versions:
  - ANY-OUT<sup>™</sup> Version (User-Adjustable Output via PCB Layout):
    - No External Resistors or Feed-Forward Capacitors Required
    - Output Voltage Range: +1.4 V to +20.5 V
  - Adjustable Version<sup>(1)</sup>:
    - Output Voltage Range: +1.4 V to +34 V
- Output Current: 1 A
- Dropout Voltage: 307 mV at 1 A
- CMOS Logic Level-Compatible Enable Pin
- Built-In Fixed Current Limit and Thermal Shutdown
- Available in High Thermal Performance Package: 5-mm x 5-mm QFN
- Operating Temperature Range: -40°C to +125°C

#### **APPLICATIONS**

- Voltage-Controlled Oscillators (VCO)
- Frequency Synthesizers
- Test and Measurement
- Instrumentation, Medical, and Audio
- RX, TX, and PA Circuitry
- Supply Rails for Operational Amplifiers, DACs, ADCs, and Other High-Precision Analog Circuitry
- Post DC-DC Converter Regulation and Ripple Filtering
- Base Stations and Telecom Infrastructure
- +12-V and +24-V Industrial Buses

### DESCRIPTION

The TPS7A47 is a family of positive voltage (+36 V), ultralow-noise (4.17  $\mu V_{RMS}$ ) low dropout linear regulators (LDO) capable of sourcing a 1-A load.

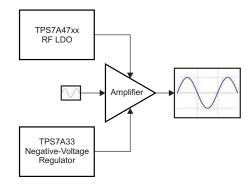

The TPS7A4700 (1-kV ESD, HBM) and TPS7A4701 (1) (> 1-kV ESD, HBM) output voltages are fully user-adjustable (up to 20.5 V) using a printed circuit board (PCB) layout without the need of external resistors or feed-forward capacitors, thus reducing overall component count.

For higher output voltage applications, use the TPS7A4701<sup>(1)</sup> (> 1-kV ESD, HBM). The TPS7A4701 achieves output voltages of up to 34 V with the use of external resistors.

The TPS7A47 is designed with bipolar technology primarily for high-accuracy, high-precision instrumentation applications where clean voltage rails are critical to maximize system performance. This feature makes the device ideal for powering operational amplifiers, analog-to-digital converters (ADCs), digital-to-analog converters (DACs), and other high-performance analog circuitry in critical applications such as medical, radio frequency (RF), and test-and-measurement.

In addition, the TPS7A47 is ideal for post dc-dc converter regulation. By filtering out the output voltage ripple inherent to dc-dc switching conversions, maximum system performance is ensured in sensitive instrumentation, test-and-measurement, audio, and RF applications.

For applications where positive and negative lownoise rails are required, consider TI's TPS7A33 family of negative high-voltage, ultralow-noise linear regulators.

(1) TPS7A4701 is product-preview device.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

ANY-OUT, PowerPAD are trademarks of Texas Instruments.

All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## PACKAGE AND ORDERING INFORMATION(1)

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or visit the device product folder at www.ti.com.

### **ABSOLUTE MAXIMUM RATINGS**

#### PIN DESCRIPTIONS

	PIN	PIN DESCRIPTIONS
PIN NAME	NUMBER	DESCRIPTION
0P1V	12	When connected to GND, this pin adds 0.1 V to the nominal output voltage of the regulator. Do not connect any voltage other than GND to this pin. If not used, leave this pin floating.
0P2V	11	When connected to GND, this pin adds 0.2 V to the nominal output voltage of the regulator. Do not connect any voltage other than GND to this pin. If not used, leave this pin floating.
0P4V	10	When connected to GND, this pin adds 0.4 V to the nominal output voltage of the regulator. Do not connect any voltage other than GND to this pin. If not used, leave this pin floating.
0P8V	9	When connected to GND, this pin adds 0.8 V to the nominal output voltage of the regulator. Do not connect any voltage other than GND to this pin. If not used, leave this pin floating.
1P6V	8	When connected to GND, this pin adds 1.6 V to the nominal output voltage of the regulator. Do not connect any voltage other than GND to this pin. If not used, leave this pin floating.
3P2V	6	When connected to GND, this pin adds 3.2 V to the nominal output voltage of the regulator. Do not connect any voltage other than GND to this pin. If not used, leave this pin floating.
6P4V1	5	When connected to GND, this pin adds 6.4 V to the nominal output voltage of the regulator. Do not connect any voltage other than GND to this pin. If not used, leave this pin floating.
6P4V2	4	When connected to GND, this pin adds 6.4 V to the nominal output voltage of the regulator. Do not connect any voltage other than GND to this pin. If not used, leave this pin floating.
EN	13	This pin turns the regulator on and off.
GND	7	Ground
IN	15, 16	Input supply. A capacitor greater than or equal to 1 µF must be tied from this pin to ground to assure stability.  A 10-µF capacitor is recommended to be connected from IN to GND (as close to the device as possible) to reduce circuit sensitivity to printed-circuit-board (PCB) layout, especially when long input traces or high source impedances are encountered.
NC	2, 17-19	This pin can be left open or tied to any voltage between GND and IN.
NR	14	Noise reduction pin. When a capacitor is connected from this pin to GND, RMS noise can be reduced to very low levels. A capacitor greater than or equal to 10 nF must be tied from this pin to ground to assure stability. A 1-µF capacitor is recommended to be connected from NR to GND (as close to the device as possible) to maximize ac performance and minimize noise.
OUT	1, 20	Regulator output. A capacitor greater than or equal to 10 $\mu$ F must be tied from this pin to ground to assure stability. A 47- $\mu$ F ceramic output capacitor is highly recommended to be connected from OUT to GND (as close to the device as possible) to maximize ac performance.
SENSE/FB	3	Control-loop error amplifier input. This is the SENSE pin if the device output voltage is programmed using ANY-OUT (no external feedback resistors). This pin must be connected to OUT. Connect this pin to the point of load to maximize accuracy. This is the FB pin if the device output voltage is set using external resistors. See the Adjustable Operation section for more details.

#### **APPLICATION INFORMATION**

#### TYPICAL APPLICATION CIRCUIT

Output voltage is set by grounding the appropriate control pins, as shown in Figure 24. When grounded, all control pins add a specific voltage on top of the internal reference voltage ( $V_{REF} = 1.4 \text{ V}$ ). For example, when grounding pins 0P1V, 0P2V, and 1P6V, the voltage values 0.1 V, 0.2 V, and 1.6 V are added to the 1.4-V internal reference voltage for  $V_{OUT(NOM)}$  equal to 3.3 V, as described in Equation 1.

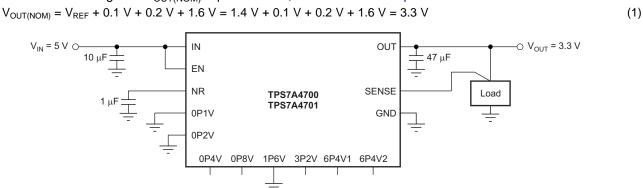

Figure 24. Maximize PSRR Performance and Minimize RMS Noise

#### ANY-OUT PROGRAMMABLE OUTPUT VOLTAGE

For ANY-OUT operation, the TPS7A4700 and TPS7A4701 (product-preview device) do not use external resistors to set the output voltage, as is typical of low-dropout regulators (LDOs), but use device pins 4, 5, 6, 8, 9, 10, 11, and 12 to program the regulated output voltage. Each pin is either connected to ground (active) or is left open, or floating, (inactive). The ANY-OUT programming is set by Equation 2 as the sum of the internal reference voltage ( $V_{REF} = 1.4 \text{ V}$ ) plus the accumulated sum of the respective voltages assigned to each active pin; that is, 100 mV (pin 12), 200 mV (pin 11), 400 mV (pin 10), 800 mV (pin 9), 1.6 V (pin 8), 3.2 V (pin 6), 6.4 V (pin 5), or 6.4 V (pin 4). Table 1 summarizes these voltage values associated with each active pin setting for reference. By leaving all program pins open, or floating, the output is thereby programmed to the minimum possible output voltage equal to  $V_{REF}$ .

$$V_{OUT} = V_{REF} + (\Sigma ANY-OUT Pins to Ground)$$
 (2)

**Table 1. ANY-OUT Programmable Output Voltage** 

ANY-OUT PROGRAM PINS (Active Low)	ADDITIVE OUTPUT VOLTAGE LEVEL
Pin 4 (6P4V2)	6.4 V
Pin 5 (6P4V1)	6.4 V
Pin 6 (3P2)	3.2 V
Pin 8 (1P6)	1.6 V
Pin 9 (0P8)	800 mV
Pin 10 (0P4)	400 mV
Pin 11 (0P2)	200 mV
Pin 12 (0P1)	100 mV

Submit Documentation Feedback

Table 2 shows a list of the most common output voltages and their corresponding pin settings. The voltage setting pins have a binary weight; therefore, the output voltage can be programmed to any value from 1.4 V to 20.5 V on 100-mV steps.

#### **ADJUSTABLE OPERATION**

**GND** 

**GND** 

**GND** 

20.5

The TPS7A4701 (product-preview device) has an output voltage range of 1.4 V to 34 V. For adjustable operation, set the nominal output voltage of the device using two external resistors, as shown in Figure 25.

**GND** 

**GND** 

**GND** 

**GND** 

**GND** 

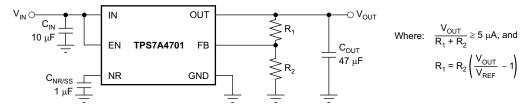

Figure 25. Adjustable Operation for Maximum AC Performance

 $R_1$  and  $R_2$  can be calculated for any output voltage range using Equation 3. To ensure stability under no load conditions at  $V_{OUT} > V_{REF}$ , this resistive network must provide a current equal to or greater than 5  $\mu$ A.

$$R_1 = R_2 \left( \frac{V_{OUT}}{V_{REF}} - 1 \right), \text{ where } \frac{V_{OUT}}{R_1 + R_2} \ge 5 \,\mu\text{A}$$
 (3)

If greater voltage accuracy is required, take into account the output voltage offset contributions because of the feedback pin current and use 0.1% tolerance resistors.

Table 3 shows the resistor combination to achieve a few of the most common rails using commercially-available, 0.1%-tolerance resistors to maximize nominal voltage accuracy while abiding to the formula shown in Equation 3.

**Table 3. Suggested Resistors for Common Voltage Rails** 

V <sub>OUT</sub>	R <sub>1</sub>	R <sub>2</sub>
1.4 V	0 Ω	∞
1.8 V	10.2 kΩ	35.7 kΩ
3.3 V	107 kΩ	78.7 kΩ
5 V	274 kΩ	107 kΩ
10 V	1.07 ΜΩ	174 kΩ
12 V	1.62 MΩ	215 kΩ
15 V	1.02 ΜΩ	105 kΩ
18 V	2.49 ΜΩ	210 kΩ
24 V	2.26 ΜΩ	140 kΩ

There are several alternative ways to set the output voltage. The program pins can be driven using external general-purpose input/output pins (GPIOs), manually connected to ground using  $0-\Omega$  resistors (or left open), or hardwired by the given layout of the printed circuit board (PCB) to set the ANY-OUT voltage. The TPS7A4700 evaluation module (EVM), available for download from www.ti.com, allows the output voltage to be programmed using jumpers.

#### CAPACITOR RECOMMENDATION

The TPS7A4700 is designed to be stable using low equivalent series resistance (ESR), ceramic capacitors at the input, output, and at the noise reduction pin (NR, pin 14). Multilayer ceramic capacitors have become the industry standard for these types of applications and are recommended here, but must be used with good judgment. Ceramic capacitors that employ X7R-, X5R-, and COG-rated dielectric materials provide relatively good capacitive stability across temperature whereas the use of Y5V-rated capacitors is discouraged precisely because the capacitance varies so widely. In all cases, ceramic capacitance varies a great deal with operating voltage and the design engineer should be aware of these characteristics. As a rule of thumb, ceramic capacitors are recommended to be derated by 50%. The input and output capacitors recommended herein account for a capacitance derating of 50%.

Attention should be given to the input capacitance to minimize transient input droop during load current steps because the TPS7A4700 has a very fast load transient response. Large input capacitances (greater than 10  $\mu$ F) have a good effect and do not affect stability. Note however that simply using large ceramic input capacitances can also cause unwanted ringing at the output if the input capacitor, in combination with the wire lead inductance, creates a high-Q peaking effect during transients. For example, a 5-nH lead inductance and a 10- $\mu$ F input capacitor form an LC filter with a resonance frequency of 712 kHz at the edge of the control loop bandwidth. Short, well-designed interconnect leads to the up-stream supply minimize this effect without adding damping. Damping of unwanted ringing can be accomplished by using a tantalum capacitor, with a few hundred milliohms of ESR, in parallel with the ceramic input capacitor.

### **Input and Output Capacitor Requirements**

The TPS7A4700 is designed and characterized for operation with ceramic capacitors of 10  $\mu$ F or greater at the input and output. Optimal noise performance is characterized using a total output capacitor value of 50  $\mu$ F. Note especially that input and output capacitances should be located as near as practical to the respective input and output pins.

## Noise Reduction Capacitor (C<sub>NR</sub>)

The noise reduction capacitor, connected to the NR pin of the LDO, forms an RC filter for filtering out noise that might ordinarily be amplified by the control loop and appear on the output voltage. Larger capacitances, up to 1  $\mu$ F, affect noise reduction at lower frequencies while also tending to further reduce noise at higher frequencies. Note that  $C_{NR}$  also serves a secondary purpose in programming the turn-on rise time of the output voltage and thereby controls the turn-on surge current.

Submit Documentation Feedback

## INTERNAL CURRENT LIMIT (ICI)

The internal current limit circuit is used to protect the LDO against high-load current faults or shorting events. The LDO is not designed to operate at a steady-state current limit. During a current-limit event, the LDO sources constant current. Therefore, the output voltage falls while load impedance decreases. Note also that when a current limit occurs while the resulting output voltage is low, excessive power may be dissipated across the LDO, which results in a thermal shutdown of the output.

## DROPOUT VOLTAGE (VDO)

Generally speaking, the dropout voltage often refers to the voltage difference between the input and output voltage ( $V_{DO} = V_{IN} - V_{OUT}$ ). However, in the Electrical Characteristics  $V_{DO}$  is defined as the  $V_{IN} - V_{OUT}$  voltage at the rated current ( $I_{RATED}$ ), where the main current pass-FET is fully on in the Ohmic region of operation and is characterized by the classic  $R_{DS(ON)}$  of the FET.  $V_{DO}$  indirectly specifies a minimum input voltage above the nominal programmed output voltage at which the output voltage is expected to remain within its accuracy boundary. If the input falls below this  $V_{DO}$  limit ( $V_{IN} < V_{OUT} + V_{DO}$ ), then the output voltage decreases in order to follow the input voltage.

Dropout voltage is always determined by the  $R_{DS(ON)}$  of the main pass-FET. Therefore, if the LDO operates below the rated current, then the  $V_{DO}$  for that current scales accordingly. The  $R_{DS(ON)}$  for the TPS7A4700 can be calculated using Equation 4:

$$R_{DS(ON)} = \frac{V_{DO}}{I_{RATED}}$$
(4)

#### **OUTPUT VOLTAGE ACCURACY**

The output voltage accuracy specifies minimum and maximum output voltage error, relative to the expected nominal output voltage stated as a percent. This accuracy error typically includes the errors introduced by the internal reference and the load and line regulation across the full range of rated load and line operating conditions over temperature, unless otherwise specified by the Electrical Characteristics. Output voltage accuracy also accounts for all variations between manufacturing lots.

#### **STARTUP**

#### Enable (EN) and Under-Voltage Lockout (UVLO)

The TPS7A4700 only turns on when both EN and UVLO are above the respective voltage thresholds. The UVLO circuit monitors input voltage ( $V_{IN}$ ) to prevent device turn-on before  $V_{IN}$  rises above the lockout voltage. The UVLO circuit also causes a shutdown when  $V_{IN}$  falls below lockout. The EN signal allows independent logic-level turn-on and shutdown of the LDO when the input voltage is present. EN can be connected directly to  $V_{IN}$  if independent turn-on is not needed.

#### **Soft-Start and Inrush Current**

Soft-start refers to the ramp-up characteristic of the output voltage during LDO turn-on after EN and UVLO have achieved threshold voltage. The noise reduction capacitor serves a dual purpose of both governing output noise reduction and programming the soft-start ramp during turn-on.

Inrush current is defined as the current through the LDO from IN to OUT during the time of the turn-on ramp up. Inrush current then consists primarily of the sum of load and charge current to the output capacitor. This current is difficult to measure because the input capacitor must be removed, which is not recommended. However, this soft-start current can be estimated by Equation 5:

$$I_{OUT(t)} = \left[\frac{C_{OUT} \times dV_{OUT}(t)}{dt}\right] + \left[\frac{V_{OUT}(t)}{R_{LOAD}}\right]$$

where:

V<sub>OUT</sub>(t) is the instantaneous output voltage of the turn-on ramp,

dV<sub>OUT</sub>(t)/dt is the slope of the V<sub>OUT</sub> ramp, and

R<sub>LOAD</sub> is the resistive load impedance.

(5)

#### **AC PERFORMANCE**

LDO ac performance is typically understood to include power-supply rejection ratio, load step transient response, and output noise. These metrics are primarily a function of open-loop gain and bandwidth, phase margin, and reference noise.

## Power-Supply Rejection Ratio (PSRR)

PSRR is a measure of how well the LDO control loop rejects ripple noise from the input source to make the dc output voltage as noise-free as possible across the frequency spectrum (usually 10 Hz to 10 MHz). Even though PSRR is therefore a loss in noise signal amplitude (the output ripple relative to the input ripple), the PSRR reciprocal is plotted in the Electrical Characteristics as a positive number in decibels (dB) for convenience. Equation 6 gives the PSRR calculation as a function of frequency where input noise voltage  $[V_{S(IN)}(f)]$  and output noise voltage  $[V_{S(OUT)}(f)]$  are understood to be purely ac signals.

PSRR (dB) = 20 Log<sub>10</sub> 
$$\left[ \frac{V_{S(IN)}(f)}{V_{S(OUT)}(f)} \right]$$
 (6)

Noise that couples from the input to the internal reference voltage for the control loop is also a primary contributor to reduced PSRR magnitude and bandwidth. This reference noise is greatly filtered by the noise reduction capacitor at the NR pin of the LDO in combination with an internal filter resistor ( $R_{SS}$ ) for optimal PSRR.

The LDO is often employed not only as a dc/dc regulator, but also to provide exceptionally clean power-supply voltages that are free of noise and ripple to power-sensitive system components. This usage is especially true for the TPS7A4700.

#### **Load Step Transient Response**

The load step transient response is the output voltage response by the LDO to a step change in load current whereby output voltage regulation is maintained. The worst-case response is characterized for a load step of 10 mA to 1 A (at 1 A per microsecond) and shows a classic critically-damped response of a very stable system. The voltage response shows a small dip in the output voltage when charge is initially depleted from the output capacitor and then the output recovers as the control loop adjusts itself. The depth of the charge depletion immediately after the load step is directly proportional to the amount of output capacitance. However, to some extent, the speed of recovery is inversely proportional to that same output capacitance. In other words, larger output capacitances act to decrease any voltage dip or peak occurring during a load step but also decrease the control-loop bandwidth, thereby slowing response.

The worst-case off-loading step characterization occurs when the current step transitions from 1 A to 0 mA. Initially, the LDO loop cannot respond fast enough to prevent a small increase in output voltage charge on the output capacitor. Because the LDO cannot sink charge current, the control loop must turn off the main pass-FET to wait for the charge to deplete, thus giving the off-load step its typical monotonic decay (which appears triangular in shape).

#### **Noise**

The TPS7A4700 is designed, in particular, for system applications where minimizing noise on the power-supply rail is critical to system performance. This scenario is the case for phase-locked loop (PLL)-based clocking circuits for instance, where minimum phase noise is all important, or in-test and measurement systems where even small power-supply noise fluctuations can distort instantaneous measurement accuracy. Because the TPS7A4700 is also designed for higher voltage industrial applications, the noise characteristic is well designed to minimize any increase as a function of the output voltage.

LDO noise is defined as the internally-generated intrinsic noise created by the semiconductor circuits alone. This noise is the sum of various types of noise (such as shot noise associated with current-through-pin junctions, thermal noise caused by thermal agitation of charge carriers, flicker noise or 1/f noise that is a property of resistors and dominates at lower frequencies as a function of 1/f, burst noise, and avalanche noise).

To calculate the LDO RMS output noise, a spectrum analyzer must first measure the spectral noise across the bandwidth of choice (typically 10 Hz to 100 kHz in units of  $\mu V/\sqrt{Hz}$ ). The RMS noise is then calculated in the usual manner as the integrated square root of the squared spectral noise over the band, then averaged by the bandwidth.

#### THERMAL INFORMATION

#### **Thermal Protection**

The TPS7A4700 contains a thermal shutdown protection circuit to turn off the output current when excessive heat is dissipated in the LDO. Thermal shutdown occurs when the thermal junction temperature (T<sub>J</sub>) of the main pass-FET exceeds +170°C (typical). Thermal shutdown hysteresis assures that the LDO again resets (turns on) when the temperature falls to +150°C (typical). Because the TPS7A4700 is capable of supporting high input voltages, a great deal of power can be expected to be dissipated across the device at low output voltages which may cause a thermal shutdown. The thermal time-constant of the semiconductor die is fairly short, and thus the output oscillates on and off at a high rate when thermal shutdown is reached until power dissipation is reduced.

For reliable operation, the junction temperature should be limited to a maximum of +125°C. To estimate the thermal margin in a given layout, increase the ambient temperature until the thermal protection shutdown is triggered using worst-case load and highest input voltage conditions. For good reliability, thermal shutdown should occur at least +45°C above the maximum expected ambient temperature condition for the application. This configuration produces a worst-case junction temperature of +125°C at the highest expected ambient temperature and worst-case load.

The internal protection circuitry of the TPS7A4700 is designed to protect against thermal overload conditions. The circuitry is not intended to replace proper heat sinking. Continuously running the TPS7A4700 into thermal shutdown degrades device reliability.

### Power Dissipation (PD)

Circuit reliability demands that due consideration be given to device power dissipation, location of the circuit on the printed circuit board (PCB), and proper sizing of the thermal plane. The PCB area around the regulator should be as free as possible of other heat-generating devices that can cause added thermal stresses.

Power dissipation in the regulator depends on the input to output voltage difference and load conditions.  $P_D$  can be calculated using Equation 7:

$$P_{D} = (V_{OUT} - V_{IN}) \times I_{OUT}$$

$$(7)$$

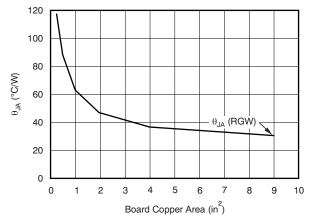

It is important to note that power dissipation can be minimized, and thus greater efficiency achieved, by proper selection of the system voltage rails. Proper selection allows the minimum input voltage necessary for output regulation to be obtained.

The primary heat conduction path for the QFN (RGW) package is through the thermal pad to the PCB. The thermal pad should be soldered to a copper pad area under the device. This pad area should then contain an array of plated vias that conduct heat to any inner spreading plane areas or to a bottom-side copper plane.

The maximum power dissipation determines the maximum allowable junction temperature  $(T_J)$  for the device. Power dissipation and junction temperature are most often related by the junction-to-ambient thermal resistance  $(\theta_{JA})$  of the combined PCB and device package and the temperature of the ambient air  $(T_A)$ , according to Equation 8.

$$T_{J} = T_{A} + (\theta_{JA} \times P_{D})$$
 (8)

Unfortunately, this thermal resistance  $(\theta_{JA})$  is highly dependant on the heat-spreading capability built into the particular PCB design, and therefore varies according to the total copper area, copper weight, and location of the spreading planes. The  $\theta_{JA}$  recorded in the Thermal Information table is determined by the JEDEC standard, PCB, and copper-spreading area and is to be used only as a relative measure of package thermal performance. Note that for a well-designed thermal layout,  $\theta_{JA}$  is actually the sum of the QFN package junction-to-case (bottom) thermal resistance  $(\theta_{JCbot})$  plus the thermal resistance contribution by the PCB copper. By knowing  $\theta_{JCbot}$ , the minimum amount of appropriate heat sinking can be used to estimate  $\theta_{JA}$  with Figure 26.  $\theta_{JCbot}$  can be found in the Thermal Information table.

NOTE:  $\theta_{JA}$  value at a board size of 9-in<sup>2</sup> (that is, 3-in × 3-in) is a JEDEC standard.

Figure 26.  $\theta_{JA}$  vs Board Size

## **Estimating Junction Temperature**

The JEDEC standard now recommends the use of PSI thermal metrics to estimate the junction temperatures of the LDO while in-circuit on a typical PCB board application. These metrics are not strictly speaking thermal resistances, but rather offer practical and relative means of estimating junction temperatures. These PSI metrics are determined to be significantly independent of copper-spreading area. The key thermal metrics ( $\Psi_{JT}$  and  $\Psi_{JB}$ ) are given in the Thermal Information table and are used in accordance with Equation 9.

$$\begin{split} \Psi_{JT} \colon T_J &= T_T + \Psi_{JT} \times P_D \\ \Psi_{JB} \colon T_J &= T_B + \Psi_{JB} \times P_D \end{split}$$

### where:

P<sub>D</sub> is the power dissipated as explained in Equation 7,

T<sub>T</sub> is the temperature at the center-top of the device package, and

T<sub>B</sub> is the PCB surface temperature measured 1 mm from the device package and centered on the package edge. (9)

www.ti.com

#### **BOARD LAYOUT**

For best overall performance, all circuit components are recommended to be located on the same side of the circuit board and as near as practical to the respective LDO pin connections. Ground return connections to the input and output capacitor, and to the LDO ground pin should also be as close to each other as possible and connected by a wide, component-side, copper surface. The use of vias and long traces to create LDO circuit connections is strongly discouraged and negatively affects system performance. This grounding and layout scheme minimizes inductive parasitics and thereby reduces load-current transients, minimizes noise, and increases circuit stability.

A ground reference plane is also recommended and should be either embedded in the PCB itself or located on the bottom side of the PCB opposite the components. This reference plane serves to assure accuracy of the output voltage, shield noise, and behaves similar to a thermal plane to spread (or sink) heat from the LDO device when connected to the PowerPAD<sup>TM</sup>. In most applications, this ground plane is necessary to meet thermal requirements.

Use the TPS7A4700EVM-094 evaluation module (EVM), available for download at www.ti.com, as a reference for layout and application design.

## **REVISION HISTORY**

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Cł	changes from Revision B (April 2013) to Revision C	Page
•	Deleted TPS7A4702 preview device from data sheet	1
Cł	changes from Revision A (July 2012) to Revision B	Page
•	Changed TPS7A47 to TPS7A4700	1
•	Changed front-page figure	1
•	Added device names to Figure 24	10
•	Added new paragraph after Table 1	11
•		11
•	Added Adjustable Operation section	11
Cł	changes from Original (June 2012) to Revision A	Page
•	Moved to full production data (changes throughout document)	1

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

- (3) MSL, Peak Temp. The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead/Ball Finish Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

PLASTIC QUAD FLATPACK NO-LEAD

### THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No—Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

## PLASTIC QUAD FLATPACK NO-LEAD

NOTES:

- ES: A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <a href="https://www.ti.com">www.ti.com</a>.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - F. Customers should contact their board fabrication site for solder mask tolerances.

#### IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
