

# SP4T SWITCH WITH IMPEDANCE DETECTION MICRO-USB SWITCH TO SUPPORT USB, UART, AUDIO, AND VIDEO

Check for Samples: [TSU6712](#)

## FEATURES

- Detection is Compatible to CEA-936A (4-Wire Protocol, UART Interface)
- USB Path Supports USB 2.0 High Speed
- Support Control Signals (USB, UART JIG) Used in Manufacturing (JIG, BOOT)
- Interrupt for Attach and Detach Accessory
- Compatible Accessories
  - USB Cable, UART Cable, TV Out Cable
  - Mono, Stereo Headset
  - Remote Controller for DMB
  - Charging + TV Out
  - Charging + Stereo Headset
- ESD Performance Tested Per JESD 22
  - 1500-V Human-Body Model (A114-B, Class II)
  - 1000-V Charged-Device Model (C101)
- ESD Performance DP/DM/ID/VBUS to GND
  - $\pm 6$ -kV Contact Discharge (IEC 61000-4-2)

RVC PACKAGE

## APPLICATIONS

- Cell Phones & Smart Phones
- Tablet PCs
- Digital Cameras & Camcorders
- GPS Navigation Systems
- Micro USB interface with USB/UART/Audio/Video

## DESCRIPTION

The TSU6712 is a multiple SP4T switch with impedance detection. The switch features impedance detection, which supports the detection of various accessories that are attached through DP and DM. The detection is based on the impedance values of the accessories as defined in Table 1. The TSU6712 is fully controlled using I<sup>2</sup>C and enables USB data, stereo and mono audio, video, microphone, and UART data to use a common connector port.

Power for this device is supplied through VBAT of the system or through VBUS when attached. The switch can be controlled through I<sup>2</sup>C. JIG and BOOT pins are used when a USB, UART JIG cable is used to test during development and manufacturing.

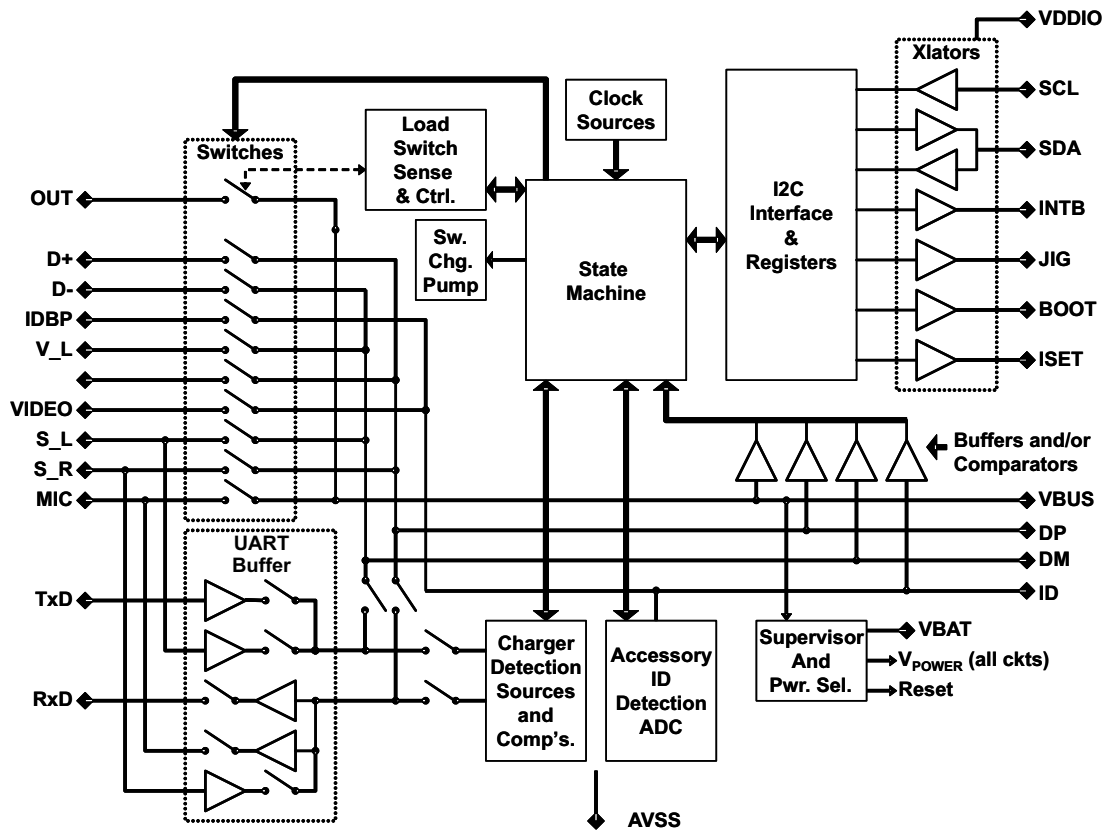

## ORDERING INFORMATION

For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at [www.ti.com](#)

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

# APPLICATION BLOCK DIAGRAM

**TERMINAL FUNCTIONS**

TERMINAL		I/O	DESCRIPTION
Ball NO.	NAME		
D1	VBAT	–	3.0 – 4.4V Battery supply voltage
A2	VDDIO	–	1.8 ~ 3.3V Logic Supply
A5	VBUS	I	USB connector VBUS
A4	OUT	O	Phone charger output
E5	GND	–	Ground
B1	D +	I/O	USB data +
C1	D -	I/O	USB data -
D2	IDBP	I/O	USB ID data
E1	RxD	I/O	UART receive data
E2	TxD	I/O	UART transmit data
D3	V_R	I/O	TV-out right sound
C3	V_L	I/O	TV-out left sound
D4	VIDEO	I/O	TV-out encoded video
B4	MIC	I/O	Microphone signal
C4	S_R	I/O	Stereo headset right sound
B3	S_L	I/O	Mono or stereo headset left sound
C2	SCL	I	I2C clock
B2	SDA	I/O	I2C data
C5	DP	I/O	Common I/O port
B5	DM	I/O	Common I/O port
D5	ID	I/O	Common I/O port
A1	INTB	O	Processor interrupt signal when peripheral is plugged/unplugged. Push-pull output
A3	ISET	O	Fast-mode charger output. Open-drain output
E4	JIG	O	GPIO factory output. Open-drain output
E3	BOOT	O	GPIO factory output. Push-pull output

## ABSOLUTE MAXIMUM RATINGS<sup>(1) (2)</sup>

over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
V <sub>BUS</sub>	Supply voltage from USB connector		-0.5	28	V
V <sub>BAT</sub>	Supply voltage from battery		-0.5	6	V
V <sub>DDIO</sub>	Logic supply voltage		-0.5	4.6	V
OUT	Phone charger output		-0.5	7	V
V <sub>AUDIO</sub>	Switch I/O voltage range	Audio Switch	-1.5	V <sub>BAT</sub> +0.5	V
V <sub>MICIO</sub>		Mic Switch	-0.5	V <sub>BAT</sub> +0.5	
V <sub>VIDEOIO</sub>		Video Switch	-1	V <sub>BAT</sub> +0.5	
V <sub>UARTIO</sub>		UART Buffer	-0.5	4.6	
V <sub>USBIO</sub>		USB Switch	-0.5	V <sub>BAT</sub> +0.5	
V <sub>LOGIC</sub>	Voltage applied to logic output (SCL, SDA, INTB, ISET, BOOT, JIG)		-0.5	4.6	V
I <sub>BUS</sub>	Peak input current on V <sub>BUS</sub> pin			2	A
I <sub>OUT</sub>	Peak output current on OUT pin			2	A
I <sub>K</sub>	Analog port diode current		-50	50	mA
I <sub>SW-DC</sub>	ON-state continuous switch current		-60	60	mA
I <sub>SW-PEAK</sub>	ON-state peak switch current		-150	150	mA
I <sub>IK</sub>	Digital logic input clamp current	V <sub>L</sub> < 0		-50	mA
I <sub>LOGIC_O</sub>	Continuous current through logic output		-50	50	mA
I <sub>GND</sub>	Continuous current through GND			100	mA
T <sub>stg</sub>	Storage temperature range		-65	150	°C

- (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
- (2) The algebraic convention, whereby the most negative value is a minimum and the most positive value is a maximum.

## THERMAL IMPEDANCE RATINGS

			UNIT
θ <sub>JA</sub>	Package thermal impedance	YFP package	98.8 °C/W

## RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

Condition	Min	Max	Units
V <sub>BUS</sub>	4.0	6.5	V
V <sub>BAT</sub>	3.0	4.4	V
V <sub>DDIO</sub>	1.8	3.3	V

### OVP ELECTRICAL CHARACTERISTICS

over operating free-air temperature range (unless otherwise noted)

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
In							
Undervoltage lockout, input power detected threshold rising	$V_{UVLO+}$	$V_{BUS}$ increasing from 0V to 5V, No load on OUT pin	2.65	2.8	3	V	
Undervoltage lockout, input power detected threshold falling	$V_{UVLO-}$	$V_{BUS}$ decreasing from 5V to 0V, No load on OUT pin	2.25	2.44	2.7	V	
Hysteresis on UVLO	$V_{HYS-UVLO}$	$\Delta$ of $V_{UVLO+}$ and $V_{UVLO-}$	150	260	550	mV	
Input to Output Characteristics							
$V_{BUS}$ switch resistance	$R_{DS-VBUSSWITCH}$	$V_{BUS} = 5\text{ V}$ , $I_{OUT} = 100\text{ mA}$		120	200	m $\Omega$	
Turn-ON time	$t_{ON}$	$R_L = 36\ \Omega$ , $C_L = 400\text{ pF}$		16		ms	
Turn-OFF time	$t_{OFF}$	$R_L = 36\ \Omega$ , $C_L = 400\text{ pF}$		50		$\mu\text{s}$	
Input Overvoltage Protection (OVP)							
Input overvoltage protection threshold	$V_{BUS}$	$V_{OVP}$	$V_{BUS}$ increasing from 6 V to 8 V	6.8	7	7.2	V
Maximum OV delay	$V_{BUS}$	$t_{PD(OVP)}$		0.25	1	$\mu\text{s}$	
Hysteresis on OVP	$V_{BUS}$	$V_{HYS-UVLO}$	$V_{BUS}$ decreasing from 8 V to 6 V	25	100	300	mV
Recovery time from input overvoltage condition	$V_{BUS}$	$t_{ON(OVP)}$	Time measured from $V_{BUS} \geq 6\text{ V}$ , 1- $\mu\text{s}$ fall-time	8		ms	

### TOTAL SWITCH CURRENT CONSUMPTION

over operating free-air temperature range (unless otherwise noted)

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT
VBAT Standby Current Consumption	$I_{BAT(Standby)}$	$V_{BUS} = 0\text{ V}$			30	$\mu\text{A}$
VBAT Operating Current Consumption	$I_{BAT(Operating)}$	$V_{BUS} = 0\text{ V}$			150	$\mu\text{A}$
VBUS Operating Current Consumption	$I_{VBUS}$	No load on OUT pin, $V_{BUS} = 5\text{ V}$	150		600	$\mu\text{A}$

## AUDIO SWITCH ELECTRICAL CHARACTERISTICS<sup>(1)</sup>

 $V_{BAT} = 3\text{ V to }4.4\text{ V}$ ,  $V_{DDIO} = 2.8\text{ V}$ ,  $T_A = -40^{\circ}\text{C to }85^{\circ}\text{C}$  (unless otherwise noted)

PARAMETER		SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT

$V_I$ OFF capacitance		$C_{I(OFF)}$	DC bias = 0 V or 3.6 V, $f = 10\text{ MHz}$ , Switch OFF		3		pF
$V_O$ OFF capacitance		$C_{O(OFF)}$	DC bias = 0 V or 3.6 V, $f = 10\text{ MHz}$ , Switch OFF		10		pF
$V_I$ , $V_O$ ON capacitance		$C_{I(ON)}$ , $C_{O(ON)}$	DC bias = 0 V or 3.6 V, $f = 10\text{ MHz}$ , Switch ON		11		pF
Bandwidth		BW	$R_L = 50\ \Omega$ , Switch ON		510		MHz
OFF Isolation		$O_{ISO}$	$f = 240\text{ MHz}$ , $R_L = 50\ \Omega$ , Switch OFF		−24		dB
Crosstalk		$X_{TALK}$	$f = 240\text{ MHz}$ , $R_L = 50\ \Omega$		−40		dB

(1)  $V_O$  is equal to the asserted voltage on DP, DM, and ID pins.  $V_I$  is equal to the asserted voltage on D<sup>+</sup>, D<sup>−</sup>, and IDBP pins.  $I_O$  is equal to the current on the DP, DM, and ID pins.  $I_I$  is equal to the current on the D<sup>+</sup>, D<sup>−</sup>, and IDBP pins.

## GENERAL OPERATION

The TSU6712 will automatically detect accessories plugged into the phone via the mini USB 5 pin connector. The type of accessory detected will be stored in I<sup>2</sup>C registers within the TSU6712 for retrieval by the host. The TSU6712 has a network of switches that can be automatically opened and closed based on the accessory detection. See Table 1 for details of which switches are open during each mode of operation. For flexibility, the TSU6712 also offers a manual switching mode allowing the host processor to decide which switches should be opened and closed and execute the settings through the I<sup>2</sup>C interface.

### Standby Mode

Standby mode is the default mode upon power up and occurs when no accessory has been detected. During this mode, the VBUS and ID lines are continually monitored through comparators to determine when an accessory is inserted. Power consumption is minimal during standby mode.

### Accessory ID Detection

If VBUS is high and the attachment is not a charger, then determine the impedance on the ID pin. If VBUS is low and an accessory is attached, then use an ADC for impedance sensing on the ID pin to identify which accessory is attached and/or what kind of remote control key button is pushed.

### Impedance Buckets for Each Accessory and Remote Control Key Button

In order to implement ID detection, each accessory and remote control key button of audio accessory should contain below ID impedance resistor value which is 1% tolerance accuracy.

## OVP OPERATION

The device continuously monitors the input voltage and the input current as described in detail in the following sections.

### Input Overvoltage Protection

When the input voltage rises above  $V_{OVP}$ , the internal  $V_{BUS}$  switch is turned off, removing power from the circuit. The response is very rapid, with the FET switch turning off in less than 1  $\mu$ s. The OVP\_EN interrupt bit is set high when an overvoltage condition is detected. When the input voltage returns below  $V_{OVP} - V_{HYS-OVP}$  and remains above  $V_{UVLO}$ , the  $V_{BUS}$  FET switch is turned on again after a deglitch time of  $t_{ON(OVP)}$ . The deglitch time ensures that the input supply has stabilized before turning the switch on. When the OVP condition is cleared, the OVP\_OCP\_DIS interrupt bit is set high.

### OVP Glitch Immunity

When  $V_{BUS}$  is near the OVP threshold, noise on  $V_{BUS}$  cause spurious OVP triggering. To avoid this, OVP glitch immunity allows noise on the  $V_{BUS}$  line to be rejected. The glitch protection circuitry integrates the glitch over time allowing the OVP circuitry to trigger faster for larger voltage excursions above the OVP threshold and slower for shorter excursions. The protection circuitry has a maximum OV delay of 1  $\mu$ s

# TSU6712

SCDS321A –MAY 2011–REVISED JULY 2013

www.ti.com

## AV Cable Detection

Once an A/V cable is attached with 365 k $\Omega$  ID resistance and/or 75  $\Omega$  load resistance, the ID voltage will drop below the internal comparator reference level of the TSU6712 and the ADC block of the TSU6712 will determine the ID line impedance value. The ID detect signal that is sent to the logic control block will be set equal to an A/V cable accessory. With the video driver in the phone enabled, detection block of the TSU6712 will sense that the 75ohm load resistance at the end of the A/V cable is still attached since the video sync pulse will always be present.

## Power-On Reset

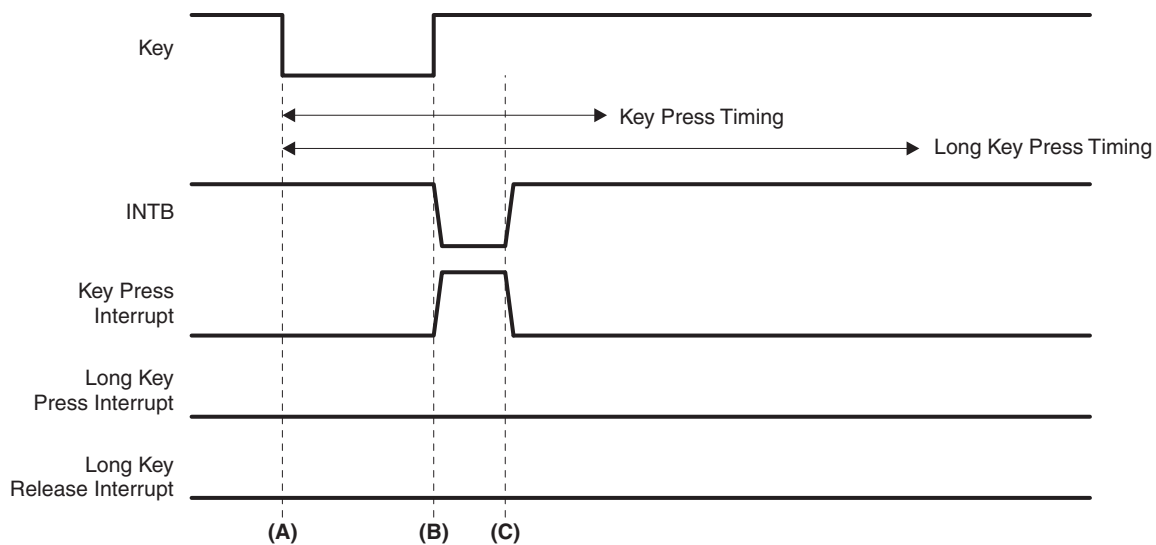

When power (from 0 V) is applied to  $V_{BAT}$ , an internal power-on reset holds the TSU6712 in a reset condition until  $V_{BAT}$  has reached  $V_{POR}$ . At that point, the reset condition is released, and the TSU6712 registers and I<sup>2</sup>C state machine initialize to their default states.

After the initial power-up phase,  $V_{BAT}$  must be lowered to below 0.2 V and then back up to the operating voltage ( $V_{DDIO}$ ) for a power-reset cycle.

## Software Reset

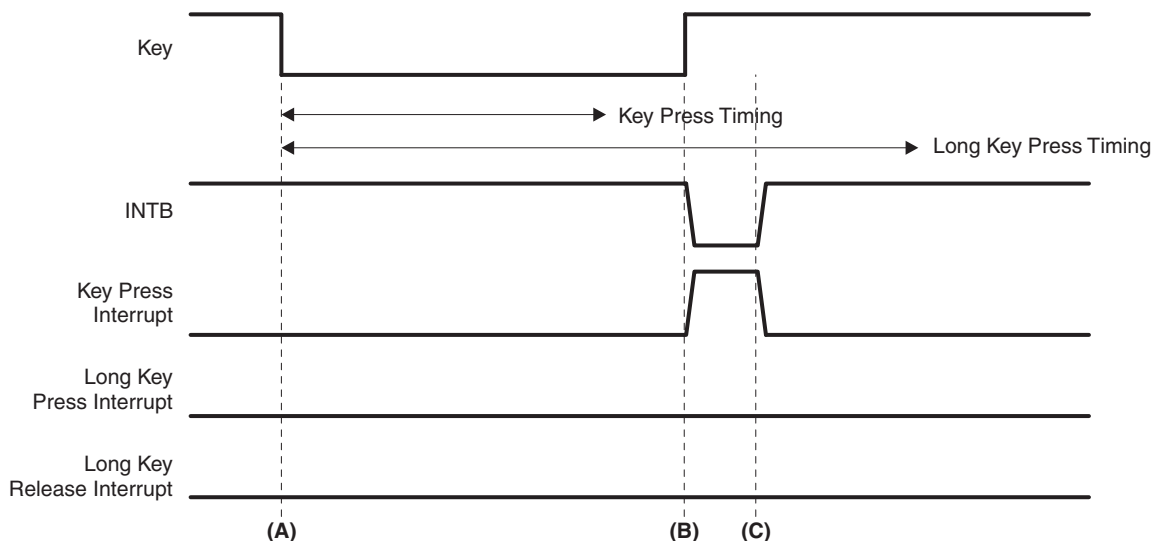

The TSU6712 has software reset feature. Hold low both SCL and SDA more than 30ms will reset digital logic of the TSU6712. After resetting, INTB will keep low until INT\_Mask bit of Control register (0x02) is cleared.

## Key Press Identification

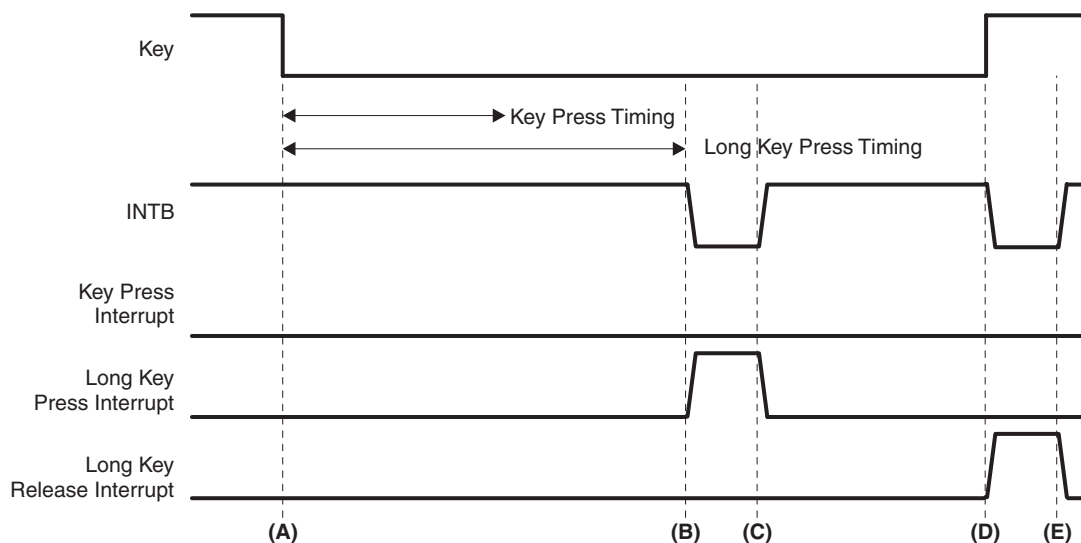

- A. Key press
- B. Released key press → Set KP Interrupt → Set error bit in Button register → INTB pulled low
- C. I<sup>2</sup>C read of INT register → Clear KP interrupt → INTB goes back high

**Figure 1. Short Key Press**

- A. Key press
- B. Released key press → Set KP Interrupt → Set Key (S/E, 1–12) bit in Button register → INTB pulled low
- C. I<sup>2</sup>C read of INT register → Clear KP interrupt → INTB goes back high

**Figure 2. Normal Key Press**

## Standard I<sup>2</sup>C Interface Details

The bidirectional I<sup>2</sup>C bus consists of the serial clock (SCL) and serial data (SDA) lines. Both lines must be connected to a positive supply via a pullup resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

I<sup>2</sup>C communication with this device is initiated by the master sending a START condition, a high-to-low transition on the SDA input/output while the SCL input is high (see [Figure 6](#)). After the start condition, the device address byte is sent, MSB first, including the data direction bit (R/W). This device does not respond to the general call address. After receiving the valid address byte, this device responds with an ACK, a low on the SDA input/output during the high of the ACK-related clock pulse.

**Figure 6. Definition of START and STOP Conditions**

The data byte follows the address ACK. The R/W bit is kept low for transfer from the master to the slave. The data byte is followed by an ACK sent from this device. Data are output only if complete bytes are received and acknowledged. The output data is valid at time (tpv) after the low-to-high transition of SCL, during the clock cycle for the ACK.

On the I<sup>2</sup>C bus, only one data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the high pulse of the clock period, as changes in the data line at this time are interpreted as control commands (START or STOP) (see Figure 7).

**Figure 7. Bit Transfer**

A Stop condition, a low-to-high transition on the SDA input/output while the SCL input is high, is sent by the master (see Figure 6).

The number of data bytes transferred between the start and the stop conditions from transmitter to receiver is not limited. Each byte of eight bits is followed by one ACK bit. The transmitter must release the SDA line before the receiver can send an ACK bit.

A slave receiver that is addressed must generate an ACK after the reception of each byte. The device that acknowledges has to pull down the SDA line during the ACK clock pulse so that the SDA line is stable low during the high pulse of the ACK-related clock period (see Figure 8). Setup and hold times must be taken into account.

**Figure 8. Acknowledgment on I<sup>2</sup>C Bus**

## Writes

Data is transmitted to the TSU6712 by sending the device slave address and setting the LSB to a logic 0 (see Figure 9 for device address). The command byte is sent after the address and determines which register receives the data that follows the command byte. The next byte is written to the specified register on the rising edge of the ACK clock pulse.

Figure 9. Write to Register

## Reads

The bus master first must send the TSU6712 slave address with the LSB set to a logic 0. The command byte is sent after the address and determines which register is accessed. After a restart, the device slave address is sent again but, this time, the LSB is set to a logic 1. Data from the register defined by the command byte then is sent by the TSU6712. Data is clocked into the SDA output shift register on the rising edge of the ACK clock pulse. See Figure 10.

Figure 10. Read From Register

## Clear INT Registers Upon Read

The TSU6712 I<sup>2</sup>C logic core is set to clear all INT bits in a register after that register is read by the host. When the acknowledge is received from the Master after the INT register has been read, the contents of the register is reset to the default state.

## I<sup>2</sup>C Timing

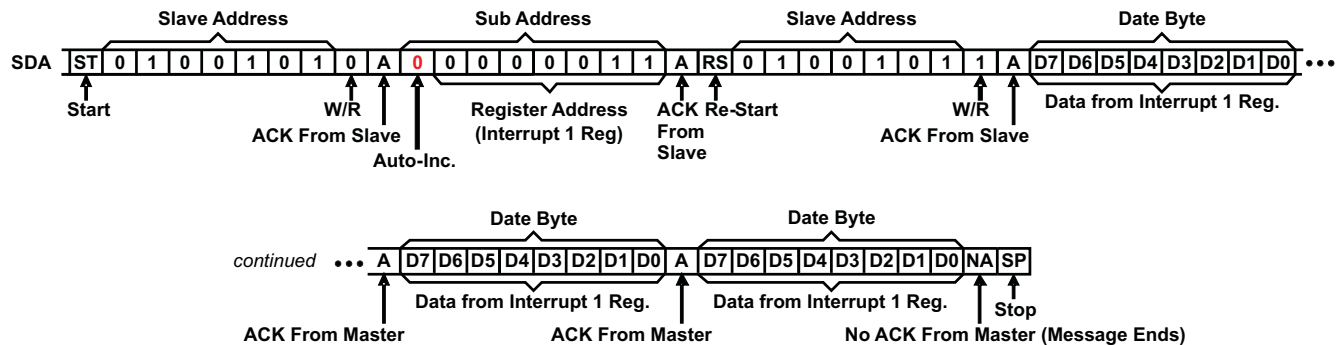

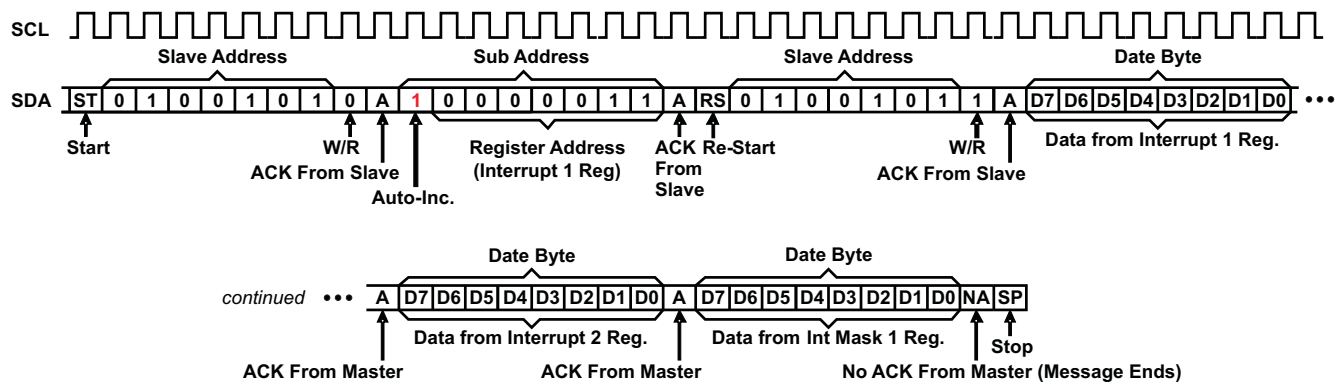

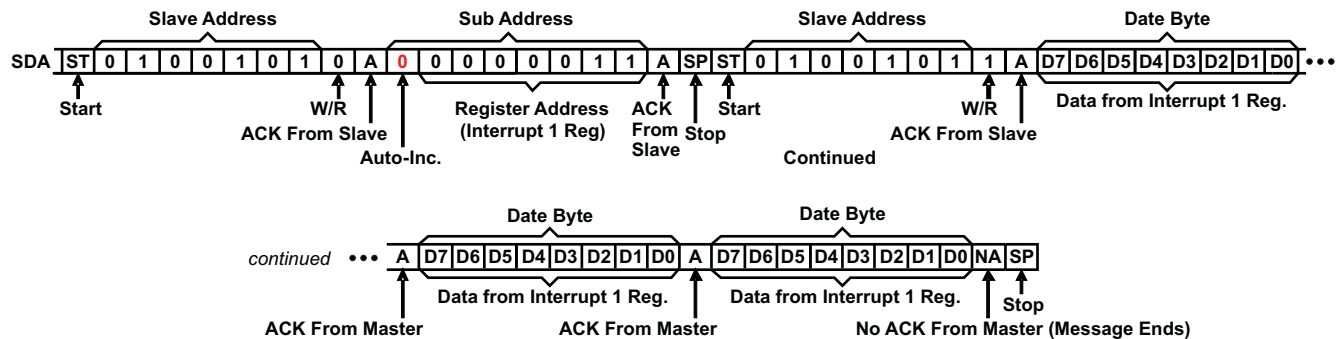

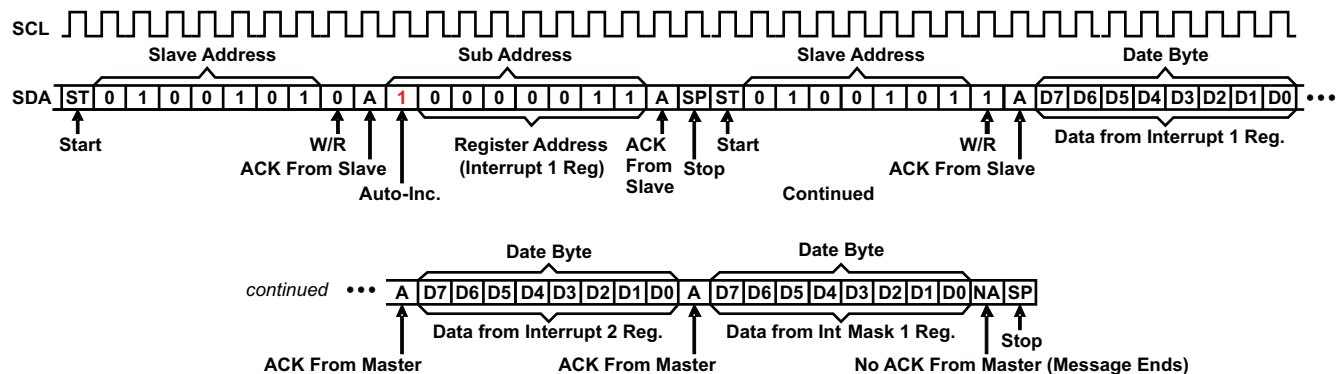

Figure 11. Repeated Data Write to a Single Register

**Figure 12. Burst Data Write to Multiple Registers**

**Figure 13. Repeated Data Read from a Single Register – Combined Mode**

**Figure 14. Burst Data Read from Multiple Registers – Combined Mode**

**Figure 15. Repeated Data Read from a Single Register – Split Mode**

**Figure 16. Burst Data Read from Multiple Registers – Split Mode**

- SDA is pulled low on ACK from slave or ACK from master.
- Register writes always require sub-address write before first data byte.
- Repeated data writes to a single register continue indefinitely until stop or restart.
- Repeated data reads from a single register continue indefinitely until no ACK from master.
- Burst data writes start at the specified register address, then advance to the next register address, even to the read-only registers. For these registers, data write appears to occur, though no data are changed by the writes. After register 14h is written, writing resumes to register 01h and continues until stop or restart.
- Burst data reads start at the specified register address, then advance to the next register address. Once register 14h is read, reading resumes from register 01h and continues until No ACK from master.

S_L	B3	220 μF <sup>(1)</sup>
SCL	C2	1kΩ~10kΩ
SDA	B2	1kΩ~10kΩ
DM	B5	2.2Ω
		ESD Protection Diode
DP	C5	2.2Ω
		ESD Protection Diode
ID	D5	2.2Ω <sup>(1)</sup>
		ESD Protection Diode

(1) Optional Components

**Schematic Guidelines**

- V<sub>BUS</sub>, V<sub>DDIO</sub>, & V<sub>BAT</sub> require 1μF~10μF and 0.1μF decoupling capacitors to reduce noise from circuit elements. The capacitors act as a shunt to block off the noise. The 0.1μF capacitor smoothes out high frequencies and has a lower series inductance. The 1μF~10μF capacitor smoothes out the lower frequencies and has a much higher series inductance. Placing both capacitors will provide better load regulation across the frequency spectrum.
- OUT requires a 10μF load capacitor to prevent sudden increases of voltage on the pin during charging.
- JIG is an open-drain output and therefore requires a 1kΩ ~ 10kΩ pull-up resistor to V<sub>BAT</sub>.
- ISET is an open drain output. It can be used by the battery charger to set the input current limit with a series resistor (for example 75Ω determined by the charger).
- SCL and SDA require 1kΩ ~ 10kΩ pull-up resistors to V<sub>DDIO</sub> to prevent floating inputs.
- Depending on the codec used, S\_R and S\_L may require DC blocking capacitors as high as 220μF. The capacitor might not be needed if the codec has the capability to provide ground centered signals.
- MIC requires a 2.2kΩ pull-up resistor to MIC\_BIAS to provide DC bias for the microphone. Additionally the 10μF capacitor is required to block the DC signals from MIC\_BIAS to the Audio Codec.
- V<sub>BUS</sub>, DM and DP are recommended to have an external resistor 2.2Ω to provide extra ballasting to protect the chip and internal circuitry.
  - For ID, if there is less stress on the ID pin then the external 2.2Ω resistor is optional.

9. DM, DP, and ID are rated for 6kV IEC contact discharge protection. To prevent failure in case of an IEC contact discharge greater than 6kV, it is recommended to have an external ESD Protection Diode (~1pF of capacitance allowed) rated for greater than 6kV IEC protection. It is also recommended to have an external ESD Protection Diode to prevent DP and DM from failure in the event of EOS related to electrical surge propagated downstream from the AC power supply.
10.  $V_{BUS}$  is rated for 6kV IEC contact discharge protection. To prevent failure in case of an IEC contact discharge greater than 6kV, it is recommended to have an external ESD Protection Diode (~1pF of capacitance allowed) rated for greater than 6kV IEC protection. It is also recommended to have an external ESD Protection Diode to prevent VBUS from failure in the event of EOS related to electrical surge propagated downstream from the AC power supply.

## PCB Routing Guidelines

### Routing Guidelines for USB Signal Integrity

- a. All the USB lines DP, DM, D+ & D-
  - Must have 45Ω single ended characteristic impedance
  - Must have 90Ω differential ended impedance
  - To fulfill USB 2.0 requirements
- b. TSU6712 location
  - Close to the USB connector as possible
  - The distance between the USB controller and the device less than 1 inch
  - Shorter length of the trace will reduce effect of stray noise and radiate less EMI
- c. Minimize use of VIAs for USB related signals
  - Differential transmission lines should be matched as close as possible
  - No VIAs for optimum USB2.0 performance

## REVISION HISTORY

Changes from Original (May 2011) to Revision A	Page
<ul style="list-style-type: none"><li>Removed all references of carkit from document. ....</li></ul>	<a href="#">1</a>

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TSU6712YFPRB	ACTIVE	DSBGA	YFP	25	3000	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	56N	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**
**REEL DIMENSIONS**

**TAPE DIMENSIONS**

A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

**TAPE AND REEL INFORMATION**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

DIE-SIZE BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. NanoFree™ package configuration.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
